

**Note: this error code is no longer emitted by the compiler.** Too few type arguments were supplied for a function. For example:

```
fn foo<T, U>() {}
```

```
fn main() {  
    foo::<f64>(); // error: wrong number of type arguments: expected 2, found 1  
}
```

Note that if a function takes multiple type arguments but you want the compiler to infer some of them, you can use type placeholders:

```
fn foo<T, U>(x: T) {}
```

```
fn main() {  
    let x: bool = true;  
    foo::<f64>(x); // error: wrong number of type arguments:  
                  // expected 2, found 1  
    foo::<_, f64>(x); // same as `foo::<bool, f64>(x)`  
}
```
