

A select can have a `multiple` attribute, in which case it will populate an array rather than selecting a single value.

Returning to our [earlier ice cream example](#), we can replace the checkboxes with a `<select multiple>` :

```
<h2>Flavours</h2>

<select multiple bind:value={flavours}>
  {#each menu as flavour}
    <option value={flavour}>
      {flavour}
    </option>
  {/each}
</select>
```

*Press and hold the `control` key (or the `command` key on MacOS) for selecting multiple options.*
