## Search Terms

List of keywords you searched for before creating this issue. Write them down here so that others can find this suggestion more easily and help provide feedback.

## Viability Checklist

My suggestion meets these guidelines:

- ☐ This wouldn't be a breaking change in existing TypeScript/JavaScript code
- ☐ This wouldn't change the runtime behavior of existing JavaScript code
- ☐ This could be implemented without emitting different JS based on the types of the expressions
- ☐ This isn't a runtime feature (e.g. library functionality, non-ECMAScript syntax with JavaScript output, new syntax sugar for JS, etc.)
- ☐ This feature would agree with the rest of [TypeScript's Design Goals](#).
