

## Go To Line package

Move the cursor to a specific line in the editor using `ctrl-g`.

The screenshot shows a code editor with a file named `go-to-line-view.coffee`. The code defines a `GoToLineView` class that extends `View`. It has an `@activate` method that creates a new `GoToLineView` instance and an `@content` method that returns a Jade template. A dialog box is open over the code, prompting the user to "Enter a line number 1-67".

```
1  {$, EditorView, Point, View}
2
3  module.exports =
4  class GoToLineView extends View
5    @activate: -> new GoToLineView
6
7    @content: ->
8      @div class: 'go-to-line overlay from-top mini', =>
9        @subview 'miniEditor', new EditorView(mini: true)
10       @div class: 'message', outlet: 'message'
```
