

Jump plugin

This plugin allows to easily jump around the file system by manually adding marks. Those marks are stored as symbolic links in the directory `$MARKPATH` (default `$HOME/.marks`)

To use it, add `jump` to the plugins array in your zshrc file:

```
plugins=(... jump)
```

Commands

Command	Description
<code>jump <mark-name></code>	Jump to the given mark
<code>mark [mark-name]</code>	Create a mark with the given name or with the name of the current directory if none is provided
<code>unmark <mark-name></code>	Remove the given mark
<code>marks</code>	List the existing marks and the directories they point to

Key bindings

Pressing `CTRL + G` substitutes the written mark name for the full path of the mark. For example, with a mark named `mymark` pointing to `/path/to/my/mark` :

```
$ cp /tmp/file mymark<C-g>
```

will become:

```
$ cp /tmp/file /path/to/my/mark
```
