

React Container component

Container

The container centers your content horizontally. It's the most basic layout element.

While containers can be nested, most layouts do not require a nested container.

```
{{"component": "modules/components/ComponentLinkHeader.js", "design": false}}
```

Fluid

A fluid container width is bounded by the `maxWidth` prop value.

```
{{"demo": "SimpleContainer.js", "iframe": true, "defaultCodeOpen": false}}
```

```
<Container maxWidth="sm">
```

Fixed

If you prefer to design for a fixed set of sizes instead of trying to accommodate a fully fluid viewport, you can set the `fixed` prop. The max-width matches the min-width of the current breakpoint.

```
{{"demo": "FixedContainer.js", "iframe": true, "defaultCodeOpen": false}}
```

```
<Container fixed>
```
