

# Bulma

Bulma is a **modern CSS framework** based on [Flexbox](#).

 release **v0.9.4**  npm **v0.9.4**  downloads **950k/month**  jsDelivr **94M hits/month**

 **awesome**  chat  on github  build  error

## Quick install

Bulma is constantly in development! Try it out now:

### NPM

```
npm install bulma
```

or

### Yarn

```
yarn add bulma
```

### Bower

```
bower install bulma
```

## Import

After installation, you can import the CSS file into your project using this snippet:

```
@import 'bulma/css/bulma.css'
```

## CDN

<https://www.jsdelivr.com/package/npm/bulma>

Feel free to raise an issue or submit a pull request.

## CSS only

Bulma is a **CSS** framework. As such, the sole output is a single CSS file: [bulma.css](#)

You can either use that file, "out of the box", or download the Sass source files to customize the [variables](#).

There is **no** JavaScript included. People generally want to use their own JS implementation (and usually already have one). Bulma can be considered "environment agnostic": it's just the style layer on top of the logic.

## Browser Support

Bulma uses [autoprefixer](#) to make (most) Flexbox features compatible with earlier browser versions. According to [Can I use](#), Bulma is compatible with **recent** versions of:

- Chrome
- Edge
- Firefox
- Opera
- Safari

Internet Explorer (10+) is only partially supported.

## Documentation

The documentation resides in the [docs](#) directory, and is built with the Ruby-based [Jekyll](#) tool.
