

Auxilliary files for dev/release.sh

- release-state-fn.sh

This is the main version and state update logic... you could say that it's the innermost engine for the release mechanism. It tries to be agnostic of versioning schemes, and relies on release-version-fn.sh to supply necessary functions that are specific for versioning schemes.

- release-version-fn.sh

Supplies functions that are specific to versioning schemes:

get_version() gets the version data from appropriate files.

set_version() writes the version data to appropriate files.

fixup_version() updates the version data, given a first argument that instructs it what update to do.

- openssl-announce-pre-release.tmpl and openssl-announce-release.tmpl

Templates for announcements

- fixup--release.pl and fixup--postrelease.pl

Fixup scripts for specific files, to be done for the release commit and for the post-release commit.
