

What's New In Python 3.0

Author: Guido van Rossum

This article explains the new features in Python 3.0, compared to 2.6. Python 3.0, also known as "Python 3000" or "Py3K", is the first ever *intentionally backwards incompatible* Python release. There are more changes than in a typical release, and more that are important for all Python users. Nevertheless, after digesting the changes, you'll find that Python really hasn't changed all that much -- by and large, we're mostly fixing well-known annoyances and warts, and removing a lot of old cruft.

This article doesn't attempt to provide a complete specification of all new features, but instead tries to give a convenient overview. For full details, you should refer to the documentation for Python 3.0, and/or the many PEPs referenced in the text. If you want to understand the complete implementation and design rationale for a particular feature, PEPs usually have more details than the regular documentation; but note that PEPs usually are not kept up-to-date once a feature has been fully implemented.

Due to time constraints this document is not as complete as it should have been. As always for a new release, the `Misc/NEWS` file in the source distribution contains a wealth of detailed information about every small thing that was changed.

Common Stumbling Blocks

This section lists those few changes that are most likely to trip you up if you're used to Python 2.5.

Print Is A Function

The `print` statement has been replaced with a `func:'print'` function, with keyword arguments to replace most of the special syntax of the old `print` statement ([PEP 3105](#)). Examples:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 97); [backlink](#)

Unknown interpreted text role "func".

```
Old: print "The answer is", 2*2
New: print("The answer is", 2*2)
```

```
Old: print x,           # Trailing comma suppresses newline
New: print(x, end=" ")  # Appends a space instead of a newline
```

```
Old: print             # Prints a newline
New: print()           # You must call the function!
```

```
Old: print >>sys.stderr, "fatal error"
New: print("fatal error", file=sys.stderr)
```

```
Old: print (x, y)       # prints repr((x, y))
New: print((x, y))      # Not the same as print(x, y)!
```

You can also customize the separator between items, e.g.:

```
print("There are <", 2**32, "> possibilities!", sep="")
```

which produces:

System Message: WARNING/2 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 122)

Cannot analyze code. No Pygments lexer found for "none".

```
.. code-block:: none
```

```
There are <4294967296> possibilities!
```

Note:

- The `func:'print'` function doesn't support the "softspace" feature of the old `print` statement. For example, in Python 2.x, `print "A\n", "B"` would write `"A\nB\n"`; but in Python 3.0, `print("A\n", "B")` writes `"A\n B\n"`.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 128); [backlink](#)

Unknown interpreted text role "func".

- Initially, you'll be finding yourself typing the old `print x` a lot in interactive mode. Time to retrain your fingers to type `print(x)` instead!
- When using the `2to3` source-to-source conversion tool, all `print` statements are automatically converted to `:func:'print'` function calls, so this is mostly a non-issue for larger projects.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 137); [backlink](#)

Unknown interpreted text role "func".

Views And Iterators Instead Of Lists

Some well-known APIs no longer return lists:

- `:class:'dict'` methods `:meth:'dict.keys'`, `:meth:'dict.items'` and `:meth:'dict.values'` return "views" instead of lists. For example, this no longer works: `k = d.keys(); k.sort()`. Use `k = sorted(d)` instead (this works in Python 2.5 too and is just as efficient).

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 147); [backlink](#)

Unknown interpreted text role "class".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 147); [backlink](#)

Unknown interpreted text role "meth".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 147); [backlink](#)

Unknown interpreted text role "meth".

Unknown interpreted text role "meth".

- `:func:'map'` and `:func:'filter'` return iterators. If you really need a list and the input sequences are all of equal length, a quick fix is

to wrap `:func:`map`` in `:func:`list``, e.g. `list(map(...))`, but a better fix is often to use a list comprehension (especially when the original code uses `:keyword:`lambda``), or rewriting the code so it doesn't need a list at all. Particularly tricky is `:func:`map`` invoked for the side effects of the function; the correct transformation is to use a regular `:keyword:`for`` loop (since creating a list would just be wasteful).

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 156);

[backlink](#)

Unknown interpreted text role "keyword".

If the input sequences are not of equal length, `:func:`map`` will stop at the termination of the shortest of the sequences. For full compatibility with `:func:`map`` from Python 2.x, also wrap the sequences in `:func:`itertools.zip_longest``, e.g. `map(func, *sequences)` becomes `list(map(func, itertools.zip_longest(*sequences)))`.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 167);
[backlink](#)

Unknown interpreted text role "func".

Unknown interpreted text role "func".

- `:func:`zip`` now returns an iterator.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 177);
[backlink](#)

Unknown interpreted text role "func".

Ordering Comparisons

Python 3.0 has simplified the rules for ordering comparisons:

- The ordering comparison operators (`<`, `<=`, `>=`, `>`) raise a `TypeError` exception when the operands don't have a meaningful natural ordering. Thus, expressions like `1 < ''`, `0 > None` or `len <= len` are no longer valid, and e.g. `None < None` raises `:exc:`TypeError`` instead of returning `False`. A corollary is that sorting a heterogeneous list no longer makes sense -- all the elements must be comparable to each other. Note that this does not apply to the `==` and `!=` operators: objects of different incomparable types always compare unequal to each other.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 184);
[backlink](#)

Unknown interpreted text role "exc".

- `:meth:`builtin.sorted`` and `:meth:`list.sort`` no longer accept the `cmp` argument providing a comparison function. Use the `key` argument instead. N.B. the `key` and `reverse` arguments are now "keyword-only".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 195);
[backlink](#)

Unknown interpreted text role "meth".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 195);
[backlink](#)

Unknown interpreted text role "meth".

- The `:func:`cmp`` function should be treated as gone, and the `:meth:`__cmp__`` special method is no longer supported. Use `:meth:`__lt__`` for sorting, `:meth:`__eq__`` with `:meth:`__hash__``, and other rich comparisons as needed. (If you really need the `:func:`cmp`` functionality, you could use the expression `(a > b) - (a < b)` as the equivalent for `cmp(a, b)`.)

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 200);

Unknown interpreted text role "class".

- **PEP 238**: An expression like `1/2` returns a float. Use `1//2` to get the truncating behavior. (The latter syntax has existed for years, at least since Python 2.2.)
- The `:data:`sys.maxint`` constant was removed, since there is no longer a limit to the value of integers. However,

`:data:'sys.maxsize'` can be used as an integer larger than any practical list or string index. It conforms to the implementation's "natural" integer size and is typically the same as `:data:'sys.maxint'` in previous releases on the same platform (assuming the same build options).

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 217); [backlink](#)

- Octal literals are no longer of the form `0720`; use `0o720` instead.

Text Vs. Data Instead Of Unicode Vs. 8-bit

Everything you thought you knew about binary data and Unicode has changed.

- Python 3.0 uses the concepts of *text* and (binary) *data* instead of Unicode strings and 8-bit strings. All text is Unicode; however *encoded* Unicode is represented as binary data. The type used to hold text is `:class:'str'`, the type used to hold data is `:class:'bytes'`. The biggest difference with the 2.x situation is that any attempt to mix text and data in Python 3.0 raises `:exc:'TypeError'`, whereas if you were to mix Unicode and 8-bit strings in Python 2.x, it would work if the 8-bit string happened to contain only 7-bit (ASCII) bytes, but you would get `:exc:'UnicodeDecodeError'` if it contained non-ASCII values. This value-specific behavior has caused numerous sad faces over the years.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 237); [backlink](#)

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 237); [backlink](#)

Unknown interpreted text role "exc".

- As a consequence of this change in philosophy, pretty much all code that uses Unicode, encodings or binary data most likely has to change. The change is for the better, as in the 2.x world there were numerous bugs having to do with mixing encoded and unencoded text. To be prepared in Python 2.x, start using `:class:'unicode'` for all unencoded text, and `:class:'str'` for binary or encoded data only. Then the `2to3` tool will do most of the work for you.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 250); [backlink](#)

Unknown interpreted text role "class".

- You can no longer use `u"..."` literals for Unicode text. However, you must use `b"..."` literals for binary data.
- As the `:class:'str'` and `:class:'bytes'` types cannot be mixed, you must always explicitly convert between them. Use `:meth:'str.encode'` to go from `:class:'str'` to `:class:'bytes'`, and `:meth:'bytes.decode'` to go from `:class:'bytes'` to `:class:'str'`. You can also use `bytes(s, encoding=...)` and `str(b, encoding=...)`, respectively.

- Like `:class:`str``, the `:class:`bytes`` type is immutable. There is a separate *mutable* type to hold buffered binary data, `:class:`bytearray``. Nearly all APIs that accept `:class:`bytes`` also accept `:class:`bytearray``. The mutable API is based on `:class:`collections.MutableSequence``.

Unknown interpreted text role "class".

- All backslashes in raw string literals are interpreted literally. This means that `'\u'` and `'\u'` escapes in raw strings are not treated specially. For example, `r'\u20ac'` is a string of 6 characters in Python 3.0, whereas in 2.6, `ur'\u20ac'` was the single "euro" character. (Of course, this change only affects raw string literals; the euro character is `'\u20ac'` in Python 3.0.)
- The built-in `:class:`basestring`` abstract type was removed. Use `:class:`str`` instead. The `:class:`str`` and `:class:`bytes`` types don't have functionality enough in common to warrant a shared base class. The `2to3` tool (see below) replaces every occurrence of `:class:`basestring`` with `:class:`str``.

- Files opened as text files (still the default mode for `:func:'open'`) always use an encoding to map between strings (in memory) and bytes (on disk). Binary files (opened with a `b` in the mode argument) always use bytes in memory. This means that if a file is opened using an incorrect mode or encoding, I/O will likely fail loudly, instead of silently producing incorrect data. It also means that even Unix users will have to specify the correct mode (text or binary) when opening a file. There is a platform-dependent default encoding, which on Unixy platforms can be set with the `LANG` environment variable (and sometimes also with some other platform-specific locale-related environment variables). In many cases, but not all, the system default is UTF-8; you should never count on this default. Any application reading or writing more than pure ASCII text should probably have a way to override the encoding. There is no longer any need for using the encoding-aware streams in the `:mod:'codecs'` module.

- Filenames are passed to and returned from APIs as (Unicode) strings. This can present platform-specific problems because on some platforms filenames are arbitrary byte strings. (On the other hand, on Windows filenames are natively stored as Unicode.) As a work-around, most APIs (e.g. `func:open` and many functions in the `mod:os` module) that take filenames accept `class:bytes` objects as well as strings, and a few APIs have a way to ask for a `class:bytes` return value. Thus, `func:os.listdir` returns a list of `class:bytes` instances if the argument is a `class:bytes` instance, and `func:os.getcwd` returns the current working directory as a `class:bytes` instance. Note that when `func:os.listdir` returns a list of strings, filenames that cannot be decoded properly are omitted rather than raising `exc:UnicodeError`.

Overview Of Syntax Changes

This section gives a brief overview of every *syntactic* change in Python 3.0.

New Syntax

- [PEP 3107](#): Function argument and return value annotations. This provides a standardized way of annotating a function's parameters and return value. There are no semantics attached to such annotations except that they can be introspected at runtime using the `attr: __annotations__` attribute. The intent is to encourage experimentation through metaclasses, decorators or frameworks.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 356); [backlink](#)

Unknown interpreted text role "attr".

- [PEP 3102](#): Keyword-only arguments. Named parameters occurring after `*args` in the parameter list *must* be specified using keyword syntax in the call. You can also use a bare `*` in the parameter list to indicate that you don't accept a variable-length argument list, but you do have keyword-only arguments.
- Keyword arguments are allowed after the list of base classes in a class definition. This is used by the new convention for specifying a metaclass (see next section), but can be used for other purposes as well, as long as the metaclass supports it.
- [PEP 3104](#): `keyword: nonlocal` statement. Using `nonlocal x` you can now assign directly to a variable in an outer (but non-global) scope. `keyword: !nonlocal` is a new reserved word.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-

resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 374);
[backlink](#)

Unknown interpreted text role "keyword".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 374);
[backlink](#)

Unknown interpreted text role "keyword".

- [PEP 3132](#): Extended Iterable Unpacking. You can now write things like `a, b, *rest = some_sequence`. And even `*rest, a = stuff`. The `rest` object is always a (possibly empty) list; the right-hand side may be any iterable. Example:

```
(a, *rest, b) = range(5)
```

This sets *a* to 0, *b* to 4, and *rest* to `[1, 2, 3]`.

- Dictionary comprehensions: `{k: v for k, v in stuff}` means the same thing as `dict(stuff)` but is more flexible. (This is [PEP 274](#) vindicated. :-)
- Set literals, e.g. `{1, 2}`. Note that `{}` is an empty dictionary; use `set()` for an empty set. Set comprehensions are also supported; e.g., `{x for x in stuff}` means the same thing as `set(stuff)` but is more flexible.
- New octal literals, e.g. `0o720` (already in 2.6). The old octal literals (`0720`) are gone.
- New binary literals, e.g. `0b1010` (already in 2.6), and there is a new corresponding built-in function, `func:'bin'`.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 399);
[backlink](#)

Unknown interpreted text role "func".

- Bytes literals are introduced with a leading `b` or `B`, and there is a new corresponding built-in function, `func:'bytes'`.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 402);
[backlink](#)

Unknown interpreted text role "func".

Changed Syntax

- [PEP 3109](#) and [PEP 3134](#): new `:keyword:'raise'` statement syntax: `:samp:'raise' [{expr} [from {expr}]]'`. See below.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 408);
[backlink](#)

Unknown interpreted text role "keyword".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 408);
[backlink](#)

Unknown interpreted text role "samp".

- `:keyword:'!as'` and `:keyword:'with'` are now reserved words. (Since 2.6, actually.)

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 411);
[backlink](#)

Unknown interpreted text role "keyword".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 411);
[backlink](#)

Unknown interpreted text role "keyword".

- True, False, and None are reserved words. (2.6 partially enforced the restrictions on None already.)
- Change from `:keyword:'except' exc, var` to `:keyword:'!except' exc :keyword:'!as' var`. See [PEP 3110](#).

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 417); [backlink](#)

Unknown interpreted text role "keyword".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 417); [backlink](#)

Unknown interpreted text role "keyword".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 417); [backlink](#)

Unknown interpreted text role "keyword".

- [PEP 3115](#): New Metaclass Syntax. Instead of:

```
class C:
    __metaclass__ = M
    ...
```

you must now use:

```
class C(metaclass=M):
    ...
```

The module-global `:data:'__metaclass__'` variable is no longer supported. (It was a crutch to make it easier to default to new-style classes without deriving every class from `:class:'object'`.)

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 431); [backlink](#)

Unknown interpreted text role "data".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 431); [backlink](#)

Unknown interpreted text role "class".

- List comprehensions no longer support the syntactic form `:samp:'[... for {var} in {item1}, {item2}, ...]'`. Use `:samp:'[... for {var} in ({item1}, {item2}, ...)]'` instead. Also note that list comprehensions have different semantics: they are closer to syntactic sugar for a generator expression inside a `:func:'list'` constructor, and in particular the loop control variables are no longer leaked into the surrounding scope.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 436); [backlink](#)

Unknown interpreted text role "samp".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 436); [backlink](#)

Unknown interpreted text role "samp".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 436); [backlink](#)

Unknown interpreted text role "func".

- The *ellipsis* (...) can be used as an atomic expression anywhere. (Previously it was only allowed in slices.) Also, it *must* now be spelled as ... (Previously it could also be spelled as . . ., by a mere accident of the grammar.)

Removed Syntax

- **PEP 3113**: Tuple parameter unpacking removed. You can no longer write `def foo(a, (b, c)): ...`. Use `def foo(a, b_c): b, c = b_c` instead.
- Removed backticks (use `:func:`repr`` instead).

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 456); [backlink](#)

Unknown interpreted text role "func".

- Removed `<>` (use `!=` instead).
- Removed keyword: `:func:`exec`` is no longer a keyword; it remains as a function. (Fortunately the function syntax was also accepted in 2.x.) Also note that `:func:`exec`` no longer takes a stream argument; instead of `exec(f)` you can use `exec(f.read())`.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 460); [backlink](#)

Unknown interpreted text role "func".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 460); [backlink](#)

Unknown interpreted text role "func".

- Integer literals no longer support a trailing `_l` or `L`.
- String literals no longer support a leading `_u` or `U`.
- The `:keyword:`from` module :keyword:`import` *` syntax is only allowed at the module level, no longer inside functions.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 469); [backlink](#)

Unknown interpreted text role "keyword".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 469); [backlink](#)

Unknown interpreted text role "keyword".

- The only acceptable syntax for relative imports is `:samp:`from .[{module}] import {name}``. All `:keyword:`import`` forms not starting with `.` are interpreted as absolute imports. (PEP 328)

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 472); [backlink](#)

Unknown interpreted text role "samp".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 472); [backlink](#)

Unknown interpreted text role "keyword".

- Classic classes are gone.

Changes Already Present In Python 2.6

Since many users presumably make the jump straight from Python 2.5 to Python 3.0, this section reminds the reader of new features that were originally designed for Python 3.0 but that were back-ported to Python 2.6. The corresponding sections in [ref`whats-new-in-2.6`](#) should be consulted for longer descriptions.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 482); [backlink](#)

Unknown interpreted text role "ref".

- [ref`pep-0343`](#). The `keyword:`with`` statement is now a standard feature and no longer needs to be imported from the `mod:`__future__``. Also check out [ref`new-26-context-managers`](#) and [ref`new-module-contextlib`](#).

Unknown interpreted text role "ref".

- `ref`pep-3101``. Note: the 2.6 description mentions the `meth:`format`` method for both 8-bit and Unicode strings. In 3.0, only the `class:`str`` type (text strings with Unicode support) supports this method; the `class:`bytes`` type does not. The plan is to eventually make this the only API for string formatting, and to start deprecating the `%` operator in Python 3.1.

Library Changes

Due to time constraints, this document does not exhaustively cover the very extensive changes to the standard library. [PEP 3108](#) is the reference for the major changes to the library. Here's a capsule review:

- Many old modules were removed. Some, like `:mod:`gopherlib`` (no longer used) and `:mod:`md5`` (replaced by `:mod:`hashlib``), were already deprecated by [PEP 4](#). Others were removed as a result of the removal of support for various platforms such as Irix, BeOS and Mac OS 9 (see [PEP 11](#)). Some modules were also selected for removal in Python 3.0 due to lack of use or because a better replacement exists. See [PEP 3108](#) for an exhaustive list.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 558); [backlink](#)

Unknown interpreted text role "mod".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 558); [backlink](#)

Unknown interpreted text role "mod".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 558); [backlink](#)

Unknown interpreted text role "mod".

- The `:mod:`bsddb3`` package was removed because its presence in the core standard library has proved over time to be a particular burden for the core developers due to testing instability and Berkeley DB's release schedule. However, the package is alive and well, externally maintained at <https://www.jcea.es/programacion/pybsddb.htm>.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 566); [backlink](#)

Unknown interpreted text role "mod".

- Some modules were renamed because their old name disobeyed [PEP 8](#), or for various other reasons. Here's the list:

Old Name	New Name
<code>_winreg</code>	<code>winreg</code>
<code>ConfigParser</code>	<code>configparser</code>
<code>copy_reg</code>	<code>copyreg</code>
<code>Queue</code>	<code>queue</code>
<code>SocketServer</code>	<code>socketserver</code>
<code>markupbase</code>	<code>_markupbase</code>
<code>repr</code>	<code>reprlib</code>
<code>test.test_support</code>	<code>test.support</code>

- A common pattern in Python 2.x is to have one version of a module implemented in pure Python, with an optional accelerated version implemented as a C extension; for example, `:mod:`pickle`` and `:mod:`cPickle``. This places the burden of importing the accelerated version and falling back on the pure Python version on each user of these modules. In Python 3.0, the accelerated versions are considered implementation details of the pure Python versions. Users should always import the standard version, which attempts to import the accelerated version and falls back to the pure Python version. The `:mod:`pickle`` / `:mod:`cPickle`` pair received this treatment. The `:mod:`profile`` module is on the list for 3.1. The `:mod:`StringIO`` module has been turned into a class in the `:mod:`io`` module.

PEP 3101: A New Approach To String Formatting

- A new system for built-in string formatting operations replaces the % string formatting operator. (However, the % operator is still supported; it will be deprecated in Python 3.1 and removed from the language at some later time.) Read [PEP 3101](#) for the full scoop.

Changes To Exceptions

The APIs for raising and catching exception have been cleaned up and new powerful features added:

- [PEP 352](#): All exceptions must be derived (directly or indirectly) from :exc:`BaseException`. This is the root of the exception hierarchy. This is not new as a recommendation, but the *requirement* to inherit from :exc:`BaseException` is new. (Python 2.6 still allowed classic classes to be raised, and placed no restriction on what you can catch.) As a consequence, string exceptions are finally truly and utterly dead.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 690); [backlink](#)

Unknown interpreted text role "exc".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 690); [backlink](#)

Unknown interpreted text role "exc".

- Almost all exceptions should actually derive from :exc:`Exception`; :exc:`BaseException` should only be used as a base class for exceptions that should only be handled at the top level, such as :exc:`SystemExit` or :exc:`KeyboardInterrupt`. The recommended idiom for handling all exceptions except for this latter category is to use :keyword:`except` :exc:`Exception`.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 698); [backlink](#)

Unknown interpreted text role "keyword".

- [PEP 3134](#): Exception chaining. There are two cases: implicit chaining and explicit chaining. Implicit chaining happens when an exception is raised in an `:keyword:`except`` or `:keyword:`finally`` handler block. This usually happens due to a bug in the handler block; we call this a *secondary* exception. In this case, the original exception (that was being handled) is saved as the `:attr:`__context__`` attribute of the secondary exception. Explicit chaining is invoked with this syntax:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 722); [backlink](#)

Unknown interpreted text role "keyword".

Unknown interpreted text role "keyword".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 722); [backlink](#)

Unknown interpreted text role "attr".

```
raise SecondaryException() from primary_exception
```

(where *primary_exception* is any expression that produces an exception object, probably an exception that was previously caught). In this case, the primary exception is stored on the `:attr:`__cause__`` attribute of the secondary exception. The traceback printed when an unhandled exception occurs walks the chain of `:attr:`__cause__`` and `:attr:`__context__`` attributes and prints a separate traceback for each component of the chain, with the primary exception at the top. (Java users may recognize this behavior.)

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 733); [backlink](#)

Unknown interpreted text role "attr".

Due to time constraints, here is a *very* incomplete list of changes to the C API.

- Support for several platforms was dropped, including but not limited to Mac OS 9, BeOS, RISCOS, Irix, and Tru64.
- [PEP 3118](#): New Buffer API.
- [PEP 3121](#): Extension Module Initialization & Finalization.
- [PEP 3123](#): Making `:c:macro:'PyObject_HEAD'` conform to standard C.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 864); [backlink](#)

Unknown interpreted text role "c:macro".

- No more C API support for restricted execution.
- `:c:func:'PyNumber_Coerce'`, `:c:func:'PyNumber_CoerceEx'`, `:c:func:'PyMember_Get'`, and `:c:func:'PyMember_Set'` C APIs are removed.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 868); [backlink](#)

Unknown interpreted text role "c:func".

Unknown interpreted text role "c:macro".

Performance

The net result of the 3.0 generalizations is that Python 3.0 runs the pystone benchmark around 10% slower than Python 2.5. Most likely the biggest cause is the removal of special-casing for small integers. There's room for improvement, but it will happen after 3.0 is released!

Porting To Python 3.0

For porting existing Python 2.5 or 2.6 source code to Python 3.0, the best strategy is the following:

0. (Prerequisite:) Start with excellent test coverage.
1. Port to Python 2.6. This should be no more work than the average port from Python 2.x to Python 2.(x+1). Make sure all your tests pass.
2. (Still using 2.6:) Turn on the `:option:`!-3`` command line switch. This enables warnings about features that will be removed (or change) in 3.0. Run your test suite again, and fix code that you get warnings about until there are no warnings left, and all your tests still pass.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 907); [backlink](#)

Unknown interpreted text role "option".

3. Run the `2to3` source-to-source translator over your source code tree. (See `ref`2to3-reference`` for more on this tool.) Run the result of the translation under Python 3.0. Manually fix up any remaining issues, fixing problems until all tests pass again.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.0.rst, line 913); [backlink](#)

Unknown interpreted text role "ref".

It is not recommended to try to write source code that runs unchanged under both Python 2.6 and 3.0; you'd have to use a very contorted coding style, e.g. avoiding `print` statements, metaclasses, and much more. If you are maintaining a library that needs to support both Python 2.6 and Python 3.0, the best approach is to modify step 3 above by editing the 2.6 version of the source code and running the `2to3` translator again, rather than editing the 3.0 version of the source code.

For porting C extensions to Python 3.0, please see `ref`cporting-howto``.
