

Calendar

Display date.

Basic

demo Set `value` to specify the currently displayed month. If `value` is not specified, current month is displayed.
`value` supports two-way binding.

```
<el-calendar v-model="value">
</el-calendar>

<script>
  export default {
    data() {
      return {
        value: new Date()
      }
    }
  }
</script>
```

...

Custom Content

demo Customize what is displayed in the calendar cell by setting `scoped-slot` named `dateCell`. In `scoped-slot` you can get the date (the date of the current cell), data (including the type, `isSelected`, day attribute). For details, please refer to the API documentation below.

```
<el-calendar>
  <!-- Use 2.5 slot syntax. If you use Vue 2.6, please use new slot syntax-->
  <template
    slot="dateCell"
    slot-scope="{date, data}">
    <p :class="data.isSelected ? 'is-selected' : ''">
      {{ data.day.split('-').slice(1).join('-') }} {{ data.isSelected ? '✔' : '' }}
    </p>
  </template>
</el-calendar>
<style>
  .is-selected {
    color: #1989FA;
  }
</style>
```

...

Range

:::demo Set the `range` attribute to specify the display range of the calendar. Start time must be Monday, end time must be Sunday, and the time span cannot exceed two months.

```
<el-calendar :range="['2019-03-04', '2019-03-24']">
</el-calendar>
```

...

Attributes

Attribute	Description	Type	Accepted Values	Default
value / v-model	binding value	Date/string/number	—	—
range	time range, including start time and end time. Start time must be start day of week, end time must be end day of week, the time span cannot exceed two months.	Array	—	—
first-day-of-week	first day of week	Number	1 to 7	1

dateCell Scoped Slot Parameters

Attribute	Description	Type	Accepted Values	Default
date	date the cell represents	Date	—	—
data	{ type, isSelected, day}. The <code>type</code> property indicates which month the date belongs, optional values are <code>prev-month</code> , <code>current-month</code> , <code>next-month</code> . The <code>isSelected</code> property indicates whether the date is selected. The <code>day</code> property is the formatted date in the format yyyy-MM-dd	Object	—	—
