

## New RPCs

- The **sendall** RPC spends specific UTXOs to one or more recipients without creating change. By default, the **sendall** RPC will spend every UTXO in the wallet. **sendall** is useful to empty wallets or to create a changeless payment from select UTXOs. When creating a payment from a specific amount for which the recipient incurs the transaction fee, continue to use the **subtractfeefromamount** option via the **send**, **sendtoaddress**, or **sendmany** RPCs.
