

## eslint-config-meteor

This is an ESLint configuration for Meteor apps which implements the recommendations from the Meteor Guide's section on Code style.

## Usage

### Install

Install by running:

```
meteor npm install --save-dev @meteorjs/eslint-config-meteor
```

Using `meteor npm` is optional for this package, but best-practice for Meteor projects in general.

### Peer Dependencies

This package has several peer dependencies listed in its `package.json`'s `peerDependencies` section. Warnings will be encountered during the installation step above if the project doesn't already use these modules.

The peer dependencies can be installed manually by following the `package.json` specification and using `meteor npm install --save-dev <package>` or, alternatively, using an automated tool:

```
$ # Install `install-peerdeps` within the current Meteor tool version.
$ meteor npm install --global install-peerdeps
$ # Run the newly installed `install-peerdeps` to install this package and its dependencies
$ meteor install-peerdeps --dev @meteorjs/eslint-config-meteor
```

### Configure

Add the following to the project's `package.json`:

```
"eslintConfig": {
  "extends": "@meteorjs/eslint-config-meteor"
}
```
