Instrumenting CPython with DTrace and SystemTap

Author: David Malcolm Author: Łukasz Langa

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\howto\(cpython-main\) (Doc) (howto) instrumentation.rst, line 1)

Unknown directive type "highlight".

.. highlight:: shell-session

DTrace and SystemTap are monitoring tools, each providing a way to inspect what the processes on a computer system are doing. They both use domain-specific languages allowing a user to write scripts which:

- filter which processes are to be observed
- gather data from the processes of interest
- generate reports on the data

As of Python 3.6, CPython can be built with embedded "markers", also known as "probes", that can be observed by a DTrace or SystemTap script, making it easier to monitor what the CPython processes on a system are doing.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\howto\((cpython-main)\) (Doc) (howto) instrumentation.rst, line 25)

Unknown directive type "impl-detail".

.. impl-detail::

DTrace markers are implementation details of the CPython interpreter. No guarantees are made about probe compatibility between versions of CPython. DTrace scripts can stop working or work incorrectly without warning when changing CPython versions.

Enabling the static markers

macOS comes with built-in support for DTrace. On Linux, in order to build CPython with the embedded markers for SystemTap, the SystemTap development tools must be installed.

On a Linux machine, this can be done via:

```
$ yum install systemtap-sdt-devel
or:
$ sudo apt-get install systemtap-sdt-dev
```

CPython must then be :option:'configured with the --with-dtrace option <--with-dtrace':

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\howto\(cpython-main\) (Doc) (howto) instrumentation.rst, line 49); backlink

Unknown interpreted text role "option".

System Message: WARNING/2 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\howto\(cpython-main)\Doc\howto\(instrumentation.rst, line 52)

Cannot analyze code. No Pygments lexer found for "none".

```
.. code-block:: none

checking for --with-dtrace... yes
```

On macOS, you can list available DTrace probes by running a Python process in the background and listing all probes made available by the Python provider:

```
$ python3.6 -q &
```

```
$ sudo dtrace -l -P python$! # or: dtrace -l -m python3.6
   TD PROVIDER
                            MODULE
                                                                 FUNCTION NAME
                      python3.6
python3.6
python3.6
python3.6
                                            _PyEval_EvalFrameDefault function-entry
29564 python18035
29565 python18035
                                                 dtrace_function_entry function-entry
                                                _PyEval_EvalFrameDefault function-return
29566 python18035
29567 python18035
                                                dtrace_function_return function-return
                        python3.6
29568 python18035
                                                                  collect gc-done
29569 python18035 python3.6
29570 python18035 python3.6
20571 pvthon18035 python3.6
                                                                 collect gc-start
                                               _PyEval_EvalFrameDefault line
                                                       maybe dtrace line line
```

On Linux, you can verify if the SystemTap static markers are present in the built binary by seeing if it contains a ".note.stapsdt" section.

If you've built Python as a shared library (with the :option: `--enable-shared` configure option), you need to look instead within the shared library. For example:

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\howto\(cpython-main\) (Doc) (howto) instrumentation.rst, line 81); backlink
```

Unknown interpreted text role "option".

Sufficiently modern readelf can print the metadata:

```
$ readelf -n ./python

       Arguments: 80%rbp 80%r12 -40%eax
```

The above metadata contains information for SystemTap describing how it can patch strategically-placed machine code instructions to enable the tracing hooks used by a SystemTap script.

Static DTrace probes

The following example DTrace script can be used to show the call/return hierarchy of a Python script, only tracing within the invocation of a function called "start". In other words, import-time function invocations are not going to be listed:

```
System\ Message:\ WARNING/2\ (\ D:\ \ \ \ \ \ \ )\ (Doc)\ (howto)\ instrumentation.rst,\ line\ 138) resources \cpython-main \Doc\howto\ (cpython-main) (Doc) (howto) instrumentation.rst, line\ 138)
```

Cannot analyze code. No Pygments lexer found for "none".

```
.. code-block:: none
   self int indent;
   python$target:::function-entry
    /copyinstr(arg1) == "start"/
            self->trace = 1;
   }
   python$target:::function-entry
    /self->trace/
            printf("%d\t%*s:", timestamp, 15, probename);
            printf("%*s", self->indent, "");
           printf("%s:%s:%d\n", basename(copyinstr(arg0)), copyinstr(arg1), arg2);
            self->indent++;
   python$target:::function-return
    /self->trace/
            self->indent--:
            printf("%d\t%*s:", timestamp, 15, probename);
            printf("%*s", self->indent, "");
            printf("%s:%s:%d\n", basename(copyinstr(arg0)), copyinstr(arg1), arg2);
   python$target:::function-return
    /copyinstr(arg1) == "start"/
            self->trace = 0;
    }
```

It can be invoked like this:

```
$ sudo dtrace -q -s call_stack.d -c "python3.6 script.py"
```

The output looks like this:

```
System Message: WARNING/2 (D:\onboarding-resources\sample-onboarding-
resources\cpython-main\Doc\howto\(cpython-main)(Doc)(howto)instrumentation.rst, line 178)
Cannot analyze code. No Pygments lexer found for "none".
    .. code-block:: none
        156641360502280 function-entry:call stack.py:start:23
        156641360518804 function-entry: call_stack.py:function_1:1 156641360532797 function-entry: call_stack.py:function_3:9
        156641360546807 function-return: call stack.py:function 3:10
        156641360563367 function-return: call_stack.py:function_1:2
        156641360578365 function-entry: call_stack.py:function_2:5
        156641360591757 function-entry: call_stack.py:function_1:1
        156641360605556 function-entry: call_stack.py:function_3:9
        156641360617482 function-return: call_stack.py:function_3:10 156641360629814 function-return: call_stack.py:function_1:2

        156641360719640 function-entry: call_stack.py:function_5:18
        156641360732567 function-return: call_stack.py:function_5:21
        156641360747370 function-return:call stack.py:start:28
```

Static SystemTap markers

The low-level way to use the SystemTap integration is to use the static markers directly. This requires you to explicitly state the binary file containing them.

For example, this SystemTap script can be used to show the call/return hierarchy of a Python script:

 $System\ Message:\ WARNING/2\ (\ D:\ \ \ \ \ \)\ Instrumentation.rst,\ line\ 210)$ resources \ cpython-main \ Doc \ howto \ (cpython-main) (Doc) (howto) instrumentation.rst, line\ 210)

Cannot analyze code. No Pygments lexer found for "none".

It can be invoked like this:

```
$ stap \
  show-call-hierarchy.stp \
  -c "./python test.py"
```

The output looks like this:

System Message: WARNING/2 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\howto\(cpython-main) (Doc) (howto) instrumentation.rst, line 238)

Cannot analyze code. No Pygments lexer found for 'none'.

where the columns are:

- time in microseconds since start of script
- name of executable
- PID of process

and the remainder indicates the call/return hierarchy as the script executes.

For a <u>:option:`--enable-shared`</u> build of CPython, the markers are contained within the libpython shared library, and the probe's dotted path needs to reflect this. For example, this line from the above example:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\howto\(cpython-main\) (Doc) (howto) instrumentation.rst, line 257); backlink

Unknown interpreted text role "option".

 $System\,Message:\,WARNING/2\, (\mbox{D:\noboarding-resources}\spaces) \label{lem:conboarding-resources} \labe$

Cannot analyze code. No Pygments lexer found for "none".

```
.. code-block:: none
probe process("python").mark("function__entry") {
```

```
System Message: WARNING/2 (D:\onboarding-resources\sample-onboarding-
resources\cpython-main\Doc\howto\(cpython-main)(Doc)(howto)instrumentation.rst, line 267)
```

Cannot analyze code. No Pygments lexer found for "none".

```
.. code-block:: none
  probe process("python").library("libpython3.6dm.so.1.0").mark("function entry") {
```

(assuming a ref. debug build <debug-build> of CPython 3.6)

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpythonmain\Doc\howto\(cpython-main)(Doc)(howto)instrumentation.rst, line 271); backlink

Unknown interpreted text role 'ref'.

Available static markers

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpythonmain\Doc\howto\(cpython-main)(Doc)(howto)instrumentation.rst, line 277)

Unknown directive type "object".

```
.. object:: function entry(str filename, str funcname, int lineno)
  This marker indicates that execution of a Python function has begun.
  It is only triggered for pure-Python (bytecode) functions.
  The filename, function name, and line number are provided back to the
  tracing script as positional arguments, which must be accessed using
   `$arg1``, ``$arg2``, ``$arg3``:
      * ``$arg1`` : ``(const char *)`` filename, accessible using ``user string($arg1)
       * ``$arg2`` : ``(const char *)`` function name, accessible using
         ``user string($arg2)
      * ``$arg3`` : ``int`` line number
```

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpythonmain\Doc\howto\(cpython-main\) (Doc) (howto) instrumentation.rst, line 293)

Unknown directive type "object".

```
.. object:: function return(str filename, str funcname, int lineno)
  This marker is the converse of :c:func:`function\_entry`, and indicates that
  execution of a Python function has ended (either via `return``, or via an
  exception). It is only triggered for pure-Python (bytecode) functions.
  The arguments are the same as for :c:func:`function entry`
```

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython- $\verb|main\Doc\howto\ (cpython-main) (Doc) (howto) instrumentation.rst, line 301)|$

Unknown directive type "object".

```
.. object:: line(str filename, str funcname, int lineno)
  This marker indicates a Python line is about to be executed. It is
  the equivalent of line-by-line tracing with a Python profiler. It is
  not triggered within C functions.
  The arguments are the same as for :c:func:`function entry`.
```

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpythonmain\Doc\howto\(cpython-main) (Doc) (howto) instrumentation.rst, line 309)

```
Unknown directive type "object".
```

```
.. object:: gc__start(int generation)
   Fires when the Python interpreter starts a garbage collection cycle.
   ``arg0`` is the generation to scan, like :func:`gc.collect()`.
```

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\howto\(cpython-main\) (Doc) (howto) instrumentation.rst, line 314)

Unknown directive type "object".

```
.. object:: gc__done(long collected)
Fires when the Python interpreter finishes a garbage collection
cycle. ``arg0`` is the number of collected objects.
```

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\howto\((cpython-main)\) (Doc) (howto) instrumentation.rst, line 319)

Unknown directive type "object".

```
.. object:: import__find__load__start(str modulename)
Fires before :mod:`importlib` attempts to find and load the module.
``arg0`` is the module name.
.. versionadded:: 3.7
```

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\howto\(cpython-main\) (Doc) (howto) instrumentation.rst, line 326)

Unknown directive type "object".

```
.. object:: import__find__load__done(str modulename, int found)
   Fires after :mod: `importlib`'s find_and_load function is called.
   ``arg0`` is the module name, ``arg1`` indicates if module was successfully loaded.
   .. versionadded:: 3.7
```

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\howto\(cpython-main\) (Doc) (howto) instrumentation.rst, line 335)

Unknown directive type "object".

```
.. object:: audit(str event, void *tuple)
Fires when :func:`sys.audit` or :c:func:`PySys_Audit` is called.
   ``arg0`` is the event name as C string, ``arg1`` is a :c:type:`PyObject`
   pointer to a tuple object.
   .. versionadded:: 3.8
```

SystemTap Tapsets

The higher-level way to use the SystemTap integration is to use a "tapset": SystemTap's equivalent of a library, which hides some of the lower-level details of the static markers.

Here is a tapset file, based on a non-shared build of CPython:

```
System\,Message:\,WARNING/2\, (\mbox{D:\noboarding-resources}\spaces) \label{lem:conboarding-resources} \spaces \spaces) \label{lem:conboarding-resources} \spaces \spaces) \spaces \spaces) \spaces \spaces) \spaces \spaces) \spaces \spaces) \spaces) \spaces \spaces) \spaces)
```

Cannot analyze code. No Pygments lexer found for "none".

```
.. code-block:: none
```

```
/*
    Provide a higher-level wrapping around the function__entry and
    function__return markers:
    \*/
probe python.function.entry = process("python").mark("function__entry")
{
    filename = user_string($arg1);
    funcname = user_string($arg2);
    lineno = $arg3;
    frameptr = $arg4
}
probe python.function.return = process("python").mark("function__return")
{
    filename = user_string($arg1);
    funcname = user_string($arg2);
    lineno = $arg3;
    frameptr = $arg4
}
```

If this file is installed in SystemTap's tapset directory (e.g. /usr/share/systemtap/tapset), then these additional probepoints become available:

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\howto\(cpython-main)\(Doc\) (howto) instrumentation.rst, line 378)

Unknown directive type "object".

.. object:: python.function.entry(str filename, str funcname, int lineno, frameptr)

This probe point indicates that execution of a Python function has begun.
It is only triggered for pure-Python (bytecode) functions.
```

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\howto\(cpython-main\) (Doc) (howto) instrumentation.rst, line 383)

Unknown directive type "object".

.. object:: python.function.return(str filename, str funcname, int lineno, frameptr)

This probe point is the converse of ``python.function.return``, and indicates that execution of a Python function has ended (either via ``return``, or via an exception). It is only triggered for pure-Python (bytecode) functions.
```

Examples

This SystemTap script uses the tapset above to more cleanly implement the example given above of tracing the Python function-call hierarchy, without needing to directly name the static markers:

The following script uses the tapset above to provide a top-like view of all running CPython code, showing the top 20 most

System Message: WARNING/2 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\howto\(cpython-main)\Doc\howto\(ipython-main)\) (Doc) (howto) instrumentation.rst, line 416)

Cannot analyze code. No Pygments lexer found for "none".
