${\rm Home} > {\rm puppeteer} > {\rm JSHandle} > {\rm jsonValue}$

JSHandle.jsonValue() method

```
Signature:
```

```
jsonValue<T = unknown>(): Promise<T>;
```

Returns:

Promise < T >

Returns a JSON representation of the object. If the object has a ${\tt toJSON}$ function, it will not be called.

Remarks

The JSON is generated by running JSON.stringify on the object in page and consequent JSON.parse in puppeteer. **NOTE** The method throws if the referenced object is not stringifiable.
