Name

MEDIA_IOC_DEVICE_INFO - Query device information

Synopsis

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\mediactl\(linux-master) (Documentation) (userspace-api) (media) (mediactl)media-ioc-device-info.rst, line 18)

Unknown directive type "c:macro".

.. c:macro:: MEDIA_IOC_DEVICE_INFO
```

int ioctl(int fd, MEDIA IOC DEVICE INFO, struct media device info *argp)

Arguments

fd

File descriptor returned by :c:func:'open()'.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\mediactl\(linux-master) (Documentation) (userspace-api) (media) (mediactl) media-ioc-device-info.rst, line 26); backlink

Unknown interpreted text role "c:func".

argp

Pointer to struct :c:type:'media_device_info'.

Unknown interpreted text role "c:type".

Description

All media devices must support the MEDIA_IOC_DEVICE_INFO ioctl. To query device information, applications call the ioctl with a pointer to a struct :c:type:'media_device_info'. The driver fills the structure and returns the information to the application. The ioctl never fails.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\mediactl\(linux-master) (Documentation) (userspace-api) (media) (mediactl) media-ioc-device-info.rst, line 34); backlink
Unknown interpreted text role "c:type".

.. tabularcolumns:: |p{4.4cm}|p{4.4cm}|p{8.5cm}|

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linuxmaster\Documentation\userspace-api\media\text{(linux-master) (Documentation) (userspace-api) (media) (mediactl) media-ioc-device-info.rst, line 44) Unknown directive type "flat-table". .. flat-table:: struct media_device_info :header-rows: 0 :stub-columns: 0 1 1 2 :widths: - char ``driver``\ [16] - Name of the driver implementing the media API as a NUL-terminated ASCII string. The driver version is stored in the `driver_version`` field. Driver specific applications can use this information to verify the driver identity. It is also useful to work around known bugs, or to identify drivers in error reports. - char ``model``\ [32] - Device model name as a NUL-terminated UTF-8 string. The device version is stored in the ``device version`` field and is not be appended to the model name. - char ``serial``\ [40] Serial number as a NUL-terminated ASCII string. - char ``bus info``\ [32] - Location of the device in the system as a NUL-terminated ASCII string. This includes the bus type name (PCI, USB, ...) and a bus-specific identifier. u32 - ``media_version`` - Media $\overline{\text{API}}$ version, formatted with the ``KERNEL_VERSION()`` macro. __u32 ``hw_revision`` - Hardware device revision in a driver-specific format. - _u32 - ``driver version`` - Media device driver version, formatted with the ``KERNEL VERSION()`` macro. Together with the ``driver`` field this identifies a particular driver. 1132 ``reserved``\ [31]

The <code>serial</code> and <code>bus_info</code> fields can be used to distinguish between multiple instances of otherwise identical hardware. The serial number takes precedence when provided and can be assumed to be unique. If the serial number is an empty string, the <code>bus_info</code> field can be used instead. The <code>bus_info</code> field is guaranteed to be unique, but can vary across reboots or device unplug/replug.

this array to zero.

Reserved for future extensions. Drivers and applications must set

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the ref. Generic Error Codes <gen-errors>` chapter.
