The root of the numeric hierarchy. If you just want to check if an argument x is a number, without caring what kind, use isinstance(x, Number).

The numeric tower

Subclasses of this type describe complex numbers and include the operations that work on the built-in class: complex type. These are: conversions to class: complex and class: bool, attr: real, attr: imag, +, -, *, /, **, finc: abs, meth: conjugate, ==, and !=. All except - and != are abstract.

Notes for type implementors

Implementors should be careful to make equal numbers equal and hash them to the same values. This may be subtle if there are two different extensions of the real numbers. For example, <code>:class:'fractions.Fraction'</code> implements <code>:func:'hash'</code> as follows:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main\) (Doc) (library) numbers.rst, line 87); backlink

Unknown interpreted text role "class".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main\) (Doc) (library) numbers.rst, line 87); backlink

Unknown interpreted text role "func".

```
def __hash___(self):
    if self.denominator == 1:
        # Get integers right.
        return hash(self.numerator)
# Expensive check, but definitely correct.
if self == float(self):
        return hash(float(self))
else:
        # Use tuple's hash to avoid a high collision rate on
        # simple fractions.
        return hash((self.numerator, self.denominator))
```

Adding More Numeric ABCs

There are, of course, more possible ABCs for numbers, and this would be a poor hierarchy if it precluded the possibility of adding those. You can add MyFoo between :class:`Complex` and :class:`Real` with:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main) (Doc) (library) numbers.rst, line 108); backlink

Unknown interpreted text role "class".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main\) (Doc) (library) numbers.rst, line 108); backlink

Unknown interpreted text role "class".

```
class MyFoo(Complex): ...
MyFoo.register(Real)
```

Implementing the arithmetic operations

We want to implement the arithmetic operations so that mixed-mode operations either call an implementation whose author knew about the types of both arguments, or convert both to the nearest built in type and do the operation there. For subtypes of class: 'Integral', this means that meth:' add ' and meth:' radd ' should be defined as:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main\) (Doc) (library) numbers.rst, line 122); backlink

Unknown interpreted text role "class".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main\) (Doc) (library) numbers.rst, line 122); backlink

Unknown interpreted text role "meth".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main\) (Doc) (library) numbers.rst, line 122); backlink

Unknown interpreted text role "meth".

```
class MyIntegral(Integral):
    def __add__(self, other):
        if isinstance(other, MyIntegral):
            return do_my_adding_stuff(self, other)
        elif isinstance(other, OtherTypeIKnowAbout):
            return do_my_other_adding_stuff(self, other)
        else:
            return NotImplemented

def __radd__(self, other):
    if isinstance(other, MyIntegral):
        return do_my_adding_stuff(other, self)
    elif isinstance(other, OtherTypeIKnowAbout):
```

```
return do_my_other_adding_stuff(other, self)
elif isinstance(other, Integral):
    return int(other) + int(self)
elif isinstance(other, Real):
    return float(other) + float(self)
elif isinstance(other, Complex):
    return complex(other) + complex(self)
else:
    return NotImplemented
```

There are 5 different cases for a mixed-type operation on subclasses of <code>:class:'Complex'</code>. I'll refer to all of the above code that doesn't refer to <code>MyIntegral</code> and <code>OtherTypeIKnowAbout</code> as "boilerplate". a will be an instance of <code>A</code>, which is a subtype of <code>:class:'Complex'</code> (a : <code>A <: Complex)</code>, and <code>b : B <: Complex</code>. I'll consider <code>a + b</code>:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main\) (Doc) (library) numbers.rst, line 153); backlink

Unknown interpreted text role "class".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main\) (Doc) (library) numbers.rst, line 153); backlink

Unknown interpreted text role "class".

1. If A defines an meth: add which accepts b, all is well.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main\) (Doc) (library) numbers.rst, line 160); backlink

Unknown interpreted text role 'meth'.
```

2. If A falls back to the boilerplate code, and it were to return a value from meth: __add..., we'd miss the possibility that B defines a more intelligent meth: __add..., so the boilerplate should return const: NotImplemented from <a href="mailto:meth:"...add.... (Or A may not implement <a href="mailto:meth:"...add... at all.)

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main\) (Doc) (library) numbers.rst, line 162); backlink

Unknown interpreted text role "meth".
```

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main) (Doc) (library) numbers.rst, line 162); backlink

Unknown interpreted text role "meth".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main\) (Doc) (library) numbers.rst, line 162); backlink

Unknown interpreted text role "const".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main\) (Doc)

Unknown interpreted text role "meth".

(library) numbers.rst, line 162); backlink

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main) (Doc) (library) numbers.rst, line 162); backlink

Unknown interpreted text role 'meth'.

3. Then B's meth: __radd__ ' gets a chance. If it accepts a, all is well.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main)\ (Doc) (library) numbers.rst, line 168); backlink

Unknown interpreted text role "meth".
```

- 4. If it falls back to the boilerplate, there are no more possible methods to try, so this is where the default implementation should live.
- 5. If B <: A, Python tries B. __radd__ before A. __add__. This is ok, because it was implemented with knowledge of A, so it can handle those instances before delegating to :class:`Complex`.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main) (Doc) (library) numbers.rst, line 173); backlink

Unknown interpreted text role "class".
```

If $A < : Complex and B < : Real without sharing any other knowledge, then the appropriate shared operation is the one involving the built in :class:'complex', and both :meth:'__radd__' s land there, so <math>a+b == b+a$.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main\) (Doc) (library) numbers.rst, line 178); backlink
Unknown interpreted text role "class".
```

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main\) (Doc) (library) numbers.rst, line 178); backlink
Unknown interpreted text role "meth".
```

Because most of the operations on any given type will be very similar, it can be useful to define a helper function which generates the forward and reverse instances of any given operator. For example, :class:`fractions.Fraction` uses:

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\(cpython-main) (Doc) (library) numbers.rst, line 183); backlink
```

Unknown interpreted text role "class".

```
def operator fallbacks (monomorphic operator, fallback operator):
    def forward(a, b):
        if isinstance(b, (int, Fraction)):
            return monomorphic operator(a, b)
        elif isinstance(b, float):
            return fallback operator(float(a), b)
        elif isinstance(b, complex):
            return fallback_operator(complex(a), b)
            return NotImplemented
    forward.__name__ = '__' + fallback_operator.__name__ + '_
forward.__doc__ = monomorphic_operator.__doc__
    def reverse(b, a):
        if isinstance(a, Rational):
            # Includes ints.
            return monomorphic operator(a, b)
        elif isinstance(a, numbers.Real):
            return fallback operator(float(a), float(b))
        elif isinstance(a, numbers.Complex):
            return fallback operator(complex(a), complex(b))
        else:
            return NotImplemented
    reverse.__name__ = '__r' + fallback_operator.__name__ + '_
                     = monomorphic_operator.__doc__
    reverse.__doc__
    return forward, reverse
    add(a, b):
def
    """a + b"""
    return Fraction (a.numerator * b.denominator +
                     b.numerator * a.denominator,
                     a.denominator * b.denominator)
```

```
__add__, __radd__ = _operator_fallbacks(_add, operator.add) # ...
```
