# Frame.waitForXPath() method

#### Signature:

```
waitForXPath(xpath: string, options?: WaitForSelectorOptions): Promise<ElementHandle
| null>;
```

## **Parameters**

Parameter	Туре	Description
xpath	string	the XPath expression to wait for.
options	WaitForSelectorOptions	options to configure the visiblity of the element and how long to wait before timing out.

#### **Returns:**

Promise < <u>ElementHandle</u> | null >

### **Remarks**

Wait for the <code>xpath</code> to appear in page. If at the moment of calling the method the <code>xpath</code> already exists, the method will return immediately. If the xpath doesn't appear after the <code>timeout</code> milliseconds of waiting, the function will throw.

For a code example, see the example for <u>Frame.waitForSelector()</u>. That function behaves identically other than taking a CSS selector rather than an XPath.
