gatsby-remark-custom-blocks

Note: this plugin is incompatible with <code>gatsby-transformer-remark@^4.0.0</code> because the upstream <code>remark-custom-blocks</code> package is not upgraded to remark 13 yet.

The work on upgrading to remark 13 is in progress, so follow this issue for updates.

The latest compatible version is gatsby-transformer-remark@3.2.0.

Adds custom blocks to MarkdownRemark using remark-custom-blocks.

Unlike in <u>gatsby-remark-component</u> where you can only use HTML within the custom component tag, custom blocks allow you to use markdown within the block.

Install

```
npm install gatsby-remark-custom-blocks
```

How to use

The configuration object for custom blocks follows this specification:

```
trigger: {
  classes: String, space-separated classes, optional, default: ''
  title: String, 'optional' | 'required', optional, default: custom titles not
  allowed
  details: boolean, optional, default: false
}
```

Here is an example of how you can implement custom blocks in your gatsby-config.js file:

```
plugins: [
   resolve: `gatsby-transformer-remark`,
   options: {
     plugins: [
          resolve: "gatsby-remark-custom-blocks",
          options: {
           blocks: {
              danger: {
               classes: "danger",
              },
              info: {
               classes: "info",
               title: "optional",
              },
           },
          },
        },
      ],
```

```
},
},
]
```

Use the following Markdown syntax to create blocks in your file:

```
[[danger]]
| content

[[info | This is a title!]]
| content
```

This will generate the following html:

The title configuration option can be passed either optional or required. When the required option is set in your <code>gatsby-config.js</code> the custom block will not be rendered if there is not a title argument in your markdown.

If you set the details configuration option to true the outer <div> will be changed to a details tag. If you have a title set, the title will be used as the summary.

Here is an example configuration for using details:

```
blocks: {
  danger: {
    classes: "danger",
    details: true,
  },
  info: {
    title: "optional",
    details: true,
  },
},
```

And here is the html output considering the same markdown as before:

```
<details class="custom-block danger">
    <div class="custom-block-body">content</div>
</details>
<details class="custom-block">
```
