API Routes

▼ Examples

- Basic API Routes
- API Routes with middleware
- API Routes with GraphQL
- API Routes with REST
- API Routes with CORS

API routes provide a solution to build your API with Next.js.

Any file inside the folder <code>pages/api</code> is mapped to <code>/api/*</code> and will be treated as an API endpoint instead of a <code>page</code>. They are server-side only bundles and won't increase your client-side bundle size.

For example, the following API route pages/api/user.js returns a json response with a status code of

```
export default function handler(req, res) {
  res.status(200).json({ name: 'John Doe' })
}
```

For an API route to work, you need to export a function as default (a.k.a **request handler**), which then receives the following parameters:

- req: An instance of http.IncomingMessage, plus some pre-built middlewares
- res : An instance of http://exergesponse, plus some helper functions

To handle different HTTP methods in an API route, you can use req.method in your request handler, like so:

```
export default function handler(req, res) {
  if (req.method === 'POST') {
    // Process a POST request
  } else {
    // Handle any other HTTP method
  }
}
```

To fetch API endpoints, take a look into any of the examples at the start of this section.

Use Cases

For new projects, you can build your entire API with API Routes. If you have an existing API, you do not need to forward calls to the API through an API Route. Some other use cases for API Routes are:

- Masking the URL of an external service (e.g. /api/secret instead of https://company.com/secret-url)
- Using Environment Variables on the server to securely access external services.

Caveats

 API Routes <u>do not specify CORS headers</u>, meaning they are **same-origin only** by default. You can customize such behavior by wrapping the request handler with the <u>CORS middleware</u>. • API Routes can't be used with next export
