```

The mod: pickle' module implements binary protocols for serializing and de-serializing a Python object structure. "Pickling" is the process whereby a Python object hierarchy is converted into a byte stream, and "unpickling" is the inverse operation, whereby a byte stream (from a .term'binary file' or .term'bytes-like object') is converted back into an object hierarchy. Pickling (and unpickling) is alternatively known as "serialization", "marshalling," [1] or "flattening"; however, to avoid confusion, the terms used here are "pickling" and "unpickling".

Warning

The pickle module is not secure. Only unpickle data you trust.

It is possible to construct malicious pickle data which will **execute arbitrary code during unpickling**. Never unpickle data that could have come from an untrusted source, or that could have been tampered with.

Consider signing data with mod: hmac' if you need to ensure that it has not been tampered with.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 39); backlink

Unknown interpreted text role "mod".

Safer serialization formats such as "mod: 'json' may be more appropriate if you are processing untrusted data. See ref.' comparison-with-json'.

Relationship to other Python modules

Comparison with marshal

Python has a more primitive serialization module called <u>mod: marshal</u>, but in general <u>mod: pickle</u> should always be the preferred way to serialize Python objects. <u>mod: marshal</u> exists primarily to support Python's <u>file: pyc</u> files.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 52); backlink

Unknown interpreted text role 'mod'.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 52); backlink

Unknown interpreted text role "file".

The <u>mod</u>: 'pickle' module differs from <u>mod</u>: 'marshal' in several significant ways:

Unknown interpreted text role "mod".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 57); backlink

Unknown interpreted text role "mod".

• The <u>mod</u>: pickle` module keeps track of the objects it has already serialized, so that later references to the same object won't be serialized again. <u>mod</u>: marshal' doesn't do this.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 59); backlink
```

Unknown interpreted text role "mod".

```

Unknown interpreted text role "mod".

This has implications both for recursive objects and object sharing. Recursive objects are objects that contain references to themselves. These are not handled by marshal, and in fact, attempting to marshal recursive objects will crash your Python interpreter. Object sharing happens when there are multiple references to the same object in different places in the object hierarchy being serialized. modicineters stores such objects only once, and ensures that all other references point to the master copy. Shared objects remain shared, which can be very important for mutable objects.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 63); backlink
```

Unknown interpreted text role "mod".

• mod: marshal cannot be used to serialize user-defined classes and their instances. mod: pickle can save and restore class instances transparently, however the class definition must be importable and live in the same module as when the object was stored.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 72); backlink
```

Unknown interpreted text role "mod".

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 72); backlink
```

Unknown interpreted text role 'mod'.

• The <u>mod: marshal</u> serialization format is not guaranteed to be portable across Python versions. Because its primary job in life is to support <u>file: pyc</u> files, the Python implementers reserve the right to change the serialization format in non-backwards compatible ways should the need arise. The <u>mod: pickle</u> serialization format is guaranteed to be backwards compatible across Python releases provided a compatible pickle protocol is chosen and pickling and unpickling code deals with Python 2 to Python 3 type differences if your data is crossing that unique breaking change language boundary.

```

```

Unknown interpreted text role "mod".

Comparison with json

There are fundamental differences between the pickle protocols and JSON (JavaScript Object Notation):

- JSON is a text serialization format (it outputs unicode text, although most of the time it is then encoded to utf-8), while pickle is a binary serialization format;
- JSON is human-readable, while pickle is not;
- JSON is interoperable and widely used outside of the Python ecosystem, while pickle is Python-specific;
- JSON, by default, can only represent a subset of the Python built-in types, and no custom classes; pickle can represent an extremely large number of Python types (many of them automatically, by clever usage of Python's introspection facilities; complex cases can be tackled by implementing ref: specific object APIs pickle-inst>');

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 104); backlink

Unknown interpreted text role "ref".
```

Unlike pickle, deserializing untrusted JSON does not in itself create an arbitrary code execution vulnerability.

Unknown interpreted text role "mod".

There are currently 6 different protocols which can be used for pickling. The higher the protocol used, the more recent the version of Python needed to read the pickle produced.

- Protocol version 0 is the original "human-readable" protocol and is backwards compatible with earlier versions of Python.
- Protocol version 1 is an old binary format which is also compatible with earlier versions of Python.
- Protocol version 2 was introduced in Python 2.3. It provides much more efficient pickling of :term:`new-style classes <new-style class>`. Refer to PEP 307 for information about improvements brought by protocol 2.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 149); backlink

Unknown interpreted text role "term".

• Protocol version 3 was added in Python 3.0. It has explicit support for :class:'bytes' objects and cannot be unpickled by Python 2.x. This was the default protocol in Python 3.0--3.7.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 153); backlink

Unknown interpreted text role "class".

- Protocol version 4 was added in Python 3.4. It adds support for very large objects, pickling more kinds of objects, and some
 data format optimizations. It is the default protocol starting with Python 3.8. Refer to PEP 3154 for information about
 improvements brought by protocol 4.
- Protocol version 5 was added in Python 3.8. It adds support for out-of-band data and speedup for in-band data. Refer to PEP 574 for information about improvements brought by protocol 5.

Note

Serialization is a more primitive notion than persistence; although mod: pickle' reads and writes file objects, it does not handle the issue of naming persistent objects, nor the (even more complicated) issue of concurrent access to persistent objects. The mod: pickle' module can transform a complex object into a byte stream and it can transform the byte stream into an object with the same internal structure. Perhaps the most obvious thing to do with these byte streams is to write them onto a file, but it is also conceivable to send them across a network or store them in a database. The mod: shelve' module provides a simple interface to pickle and unpickle objects on DBM-style database files.

Module Interface

To serialize an object hierarchy, you simply call the :func:'dumps' function. Similarly, to de-serialize a data stream, you call the :func:'loads' function. However, if you want more control over serialization and de-serialization, you can create a :class:'Pickler' or an :class:'Unpickler' object, respectively.

Unknown interpreted text role "class".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 296); backlink

Unknown interpreted text role "class".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 299)

Invalid class attribute value for "class" directive: "Pickler(file, protocol=None, *, fix_imports=True, buffer callback=None)".

.. class:: Pickler(file, protocol=None, *, fix_imports=True, buffer_callback=None)

This takes a binary file for writing a pickle data stream.

The optional *protocol* argument, an integer, tells the pickler to use the given protocol; supported protocols are 0 to :data: `HIGHEST_PROTOCOL`. If not specified, the default is :data: `DEFAULT_PROTOCOL`. If a negative number is specified, :data: `HIGHEST_PROTOCOL` is selected.

The *file* argument must have a write() method that accepts a single bytes argument. It can thus be an on-disk file opened for binary writing, an :class:`io.BytesIO` instance, or any other custom object that meets this interface.

If *fix_imports* is true and *protocol* is less than 3, pickle will try to map the new Python 3 names to the old module names used in Python 2, so that the pickle data stream is readable with Python 2.

If *buffer_callback* is None (the default), buffer views are serialized into *file* as part of the pickle stream.

If *buffer_callback* is not None, then it can be called any number of times with a buffer view. If the callback returns a false value (such as None), the given buffer is :ref:`out-of-band pickle-oob>`; otherwise the buffer is serialized in-band, i.e. inside the pickle stream.

It is an error if *buffer_callback* is not None and *protocol* is None or smaller than 5.

- .. versionchanged:: 3.8
 The *buffer_callback* argument was added.
- .. method:: dump(obj)

Write the pickled representation of *obj* to the open file object given in the constructor.

.. method:: persistent_id(obj)

Do nothing by default. This exists so a subclass can override it.

If :meth:`persistent_id` returns ``None``, *obj* is pickled as usual. Any other value causes :class:`Pickler` to emit the returned value as a persistent ID for *obj*. The meaning of this persistent ID should be defined by :meth:`Unpickler.persistent_load`. Note that the value returned by :meth:`persistent id` cannot itself have a persistent ID.

See :ref:`pickle-persistent` for details and examples of uses.

.. attribute:: dispatch table

A pickler object's dispatch table is a registry of *reduction functions* of the kind which can be declared using :func:`copyreg.pickle`. It is a mapping whose keys are classes and whose values are reduction functions. A reduction function takes a single argument of the associated class and should conform to the same interface as a :meth:`__reduce__` method.

By default, a pickler object will not have a :attr:`dispatch_table` attribute, and it will instead use the global dispatch table managed by the :mod:`copyreg` module. However, to customize the pickling for a specific pickler object one can set the :attr:`dispatch_table` attribute to a dict-like object. Alternatively, if a subclass of :class:`Pickler` has a :attr:`dispatch_table` attribute then this will be used as the default dispatch table for instances of that class.

See :ref:`pickle-dispatch` for usage examples.

- .. versionadded:: 3.3
- .. method:: reducer_override(obj)

Special reducer that can be defined in :class:`Pickler` subclasses. This method has priority over any reducer in the :attr:`dispatch_table`. It should conform to the same interface as a :meth:`__reduce__` method, and can optionally return ``NotImplemented`` to fallback on :attr:`dispatch_table`-registered reducers to pickle ``obj``.

For a detailed example, see :ref:`reducer override`.

- .. versionadded:: 3.8
- .. attribute:: fast

Deprecated. Enable fast mode if set to a true value. The fast mode disables the usage of memo, therefore speeding the pickling process by not generating superfluous PUT opcodes. It should not be used with self-referential objects, doing otherwise will cause :class:`Pickler` to recurse infinitely.

Use :func:`pickletools.optimize` if you need more compact pickles.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 394)

Invalid class attribute value for "class" directive: "Unpickler(file, *, fix_imports=True, encoding="ASCII", errors="strict", buffers=None)".

.. class:: Unpickler(file, *, fix imports=True, encoding="ASCII", errors="strict", buffers=None)

This takes a binary file for reading a pickle data stream.

The protocol version of the pickle is detected automatically, so no protocol argument is needed. $\,$

The argument *file* must have three methods, a read() method that takes an integer argument, a readinto() method that takes a buffer argument and a readline() method that requires no arguments, as in the :class:`io.BufferedIOBase` interface. Thus *file* can be an on-disk file opened for binary reading, an :class:`io.BytesIO` object, or any other custom object that meets this interface.

The optional arguments *fix_imports*, *encoding* and *errors* are used to control compatibility support for pickle stream generated by Python 2. If *fix_imports* is true, pickle will try to map the old Python 2 names to the new names used in Python 3. The *encoding* and *errors* tell pickle how to decode 8-bit string instances pickled by Python 2; these default to 'ASCII' and 'strict', respectively. The *encoding* can be 'bytes' to read these 8-bit string instances as bytes objects. Using ``encoding='latin1'`` is required for unpickling NumPy arrays and instances of :class:`~datetime.datetime`, :class:`~datetime.date` and :class:`~datetime.time` pickled by Python 2.

If *buffers* is None (the default), then all data necessary for deserialization must be contained in the pickle stream. This means

that the *buffer_callback* argument was None when a :class:`Pickler` was instantiated (or when :func:`dump` or :func:`dumps` was called).

If *buffers* is not None, it should be an iterable of buffer-enabled objects that is consumed each time the pickle stream references an :ref:`out-of-band <pickle-oob>` buffer view. Such buffers have been given in order to the *buffer_callback* of a Pickler object.

- .. versionchanged:: 3.8

 The *buffers* argument was added.
- .. method:: load()

Read the pickled representation of an object from the open file object given in the constructor, and return the reconstituted object hierarchy specified therein. Bytes past the pickled representation of the object are ignored.

.. method:: persistent load(pid)

Raise an :exc:`UnpicklingError` by default.

If defined, :meth:`persistent_load` should return the object specified by the persistent ID *pid*. If an invalid persistent ID is encountered, an :exc:`UnpicklingError` should be raised.

See :ref:`pickle-persistent` for details and examples of uses.

.. method:: find_class(module, name)

Import *module* if necessary and return the object called *name* from it, where the *module* and *name* arguments are :class:`str` objects. Note, unlike its name suggests, :meth:`find_class` is also used for finding functions.

Subclasses may override this to gain control over what type of objects and how they can be loaded, potentially reducing security risks. Refer to :ref:`pickle-restrict` for details.

.. audit-event:: pickle.find class module, name pickle.Unpickler.find class

A wrapper for a buffer representing picklable data. *buffer* must be a ref. buffer-providing <bufferobjects>' object, such as a term: bytes-like object' or a N-dimensional array.

Unknown interpreted text role "ref".

Unknown interpreted text role "term".

class: PickleBuffer` is itself a buffer provider, therefore it is possible to pass it to other APIs expecting a buffer-providing object, such as class: memoryview`.

.. method:: raw()

Return a :class:`memoryview` of the memory area underlying this buffer. The returned object is a one-dimensional, C-contiguous memoryview with format ``B`` (unsigned bytes). :exc:`BufferError` is raised if the buffer is neither C- nor Fortran-contiguous.

Unknown directive type "method".

.. method:: release()

Release the underlying buffer exposed by the PickleBuffer object.

What can be pickled and unpickled?

The following types can be pickled:

- None, True, and False;
- integers, floating-point numbers, complex numbers;
- strings, bytes, bytearrays;
- tuples, lists, sets, and dictionaries containing only picklable objects;
- functions (built-in and user-defined) defined at the top level of a module (using 'keyword: 'def', not 'keyword: 'lambda');

Unknown interpreted text role "ref".

Attempts to pickle unpicklable objects will raise the <code>:exc:`PicklingError`</code> exception; when this happens, an unspecified number of bytes may have already been written to the underlying file. Trying to pickle a highly recursive data structure may exceed the maximum recursion depth, a <code>:exc:`RecursionError`</code> will be raised in this case. You can carefully raise this limit with <code>:func:`sys.setrecursionlimit`</code>.

Unknown interpreted text role "func".

Note that functions (built-in and user-defined) are pickled by fully qualified name, not by value. [2] This means that only the function name is pickled, along with the name of the module the function is defined in. Neither the function's code, nor any of its function attributes are pickled. Thus the defining module must be importable in the unpickling environment, and the module must contain the named object, otherwise an exception will be raised. [3]

Similarly, classes are pickled by fully qualified name, so the same restrictions in the unpickling environment apply. Note that none of the class's code or data is pickled, so in the following example the class attribute attr is not restored in the unpickling environment:

```
class Foo:
    attr = 'A class attribute'
picklestring = pickle.dumps(Foo)
```

These restrictions are why picklable functions and classes must be defined at the top level of a module.

Similarly, when class instances are pickled, their class's code and data are not pickled along with them. Only the instance data are pickled. This is done on purpose, so you can fix bugs in a class or add methods to the class and still load objects that were created with an earlier version of the class. If you plan to have long-lived objects that will see many versions of a class, it may be worthwhile to put a version number in the objects so that suitable conversions can be made by the class's meth: __setstate __` method.

Pickling Class Instances

```
System\,Message: ERROR/3 \ (\cite{Continuous} and one-continuous and
```

Unknown directive type "currentmodule".

```
.. currentmodule:: None
```

In this section, we describe the general mechanisms available to you to define, customize, and control how class instances are pickled and unpickled.

In most cases, no additional code is needed to make instances picklable. By default, pickle will retrieve the class and the attributes of an instance via introspection. When a class instance is unpickled, its method is usually not invoked. The default behaviour first creates an uninitialized instance and then restores the saved attributes. The following code shows an implementation of this behaviour:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 559); backlink

Unknown interpreted text role "meth".

```
def save(obj):
    return (obj.__class__, obj.__dict__)

def restore(cls, attributes):
    obj = cls.__new__(cls)
    obj.__dict__.update(attributes)
    return obj
```

Classes can alter the default behaviour by providing one or several special methods:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 577)

Unknown directive type "method".

```
.. method:: object.__getnewargs_ex__()

In protocols 2 and newer, classes that implements the
:meth:`__getnewargs_ex__` method can dictate the values passed to the
:meth:`__new__` method upon unpickling. The method must return a pair
``(args, kwargs)`` where *args* is a tuple of positional arguments
and *kwargs* a dictionary of named arguments for constructing the
object. Those will be passed to the :meth:`__new__` method upon
unpickling.

You should implement this method if the :meth:`__new__` method of your
class requires keyword-only arguments. Otherwise, it is recommended for
compatibility to implement :meth:`__getnewargs__`.

.. versionchanged:: 3.6
    :meth:`__getnewargs_ex__` is now used in protocols 2 and 3.
```

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 595)

Unknown directive type "method".

```
.. method:: object.__getnewargs__()
This method serves a similar purpose as :meth:`__getnewargs_ex__`, but
supports only positional arguments. It must return a tuple of arguments
``args`` which will be passed to the :meth:`_new__` method upon unpickling.

:meth:`__getnewargs__` will not be called if :meth:`__getnewargs_ex__` is
defined.

.. versionchanged:: 3.6
    Before Python 3.6, :meth:`__getnewargs__` was called instead of
    :meth:`__getnewargs_ex__` in protocols 2 and 3.
```

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 609)

Unknown directive type "method".

- * For a class that has an instance :attr:`~object.__dict__` and no :attr:`~object.__slots__`, the default state is ``self.__dict__``
- * For a class that has an instance :attr:`~object.__dict__` and

:attr:`~object.__slots__`, the default state is a tuple consisting of two
dictionaries: ``self.__dict__``, and a dictionary mapping slot
names to slot values. Only slots that have a value are
included in the latter.

- * For a class that has :attr:`~object.__slots__` and no instance :attr:`~object.__dict__`, the default state is a tuple whose first item is ``None`` and whose second item is a dictionary mapping slot names to slot values described in the previous bullet.
- .. versionchanged:: 3.11
 Added the default implementation of the ``__getstate__()`` method in the
 :class:`object` class.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 638)

Unknown directive type "method".

.. method:: object. setstate (state)

Upon unpickling, if the class defines :meth:`__setstate__`, it is called with the unpickled state. In that case, there is no requirement for the state object to be a dictionary. Otherwise, the pickled state must be a dictionary and its items are assigned to the new instance's dictionary.

.. note:

If :meth:`__getstate__` returns a false value, the :meth:`__setstate__` method will not be called upon unpickling.

Refer to the section ref" pickle-state for more information about how to use the methods meth getstate __ and meth __ getstate __ and meth __ getstate __ .

.. index:: pair: copy; protocol

As we shall see, pickle does not use directly the methods described above. In fact, these methods are part of the copy protocol which implements the meth: reduce special method. The copy protocol provides a unified interface for retrieving the data necessary for pickling and copying objects. [4]

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 665); backlink

Unknown interpreted text role 'meth'.

Although powerful, implementing :meth: __reduce__ `directly in your classes is error prone. For this reason, class designers should use the high-level interface (i.e., :meth: __getnewargs_ex__ `, :meth: __getstate__ ` and :meth: __setstate__ `) whenever possible. We will show, however, cases where using :meth: __reduce__ ` is the only option or leads to more efficient pickling or both.

Unknown directive type 'method'.

.. method:: object.__reduce__()

The interface is currently defined as follows. The :meth:`__reduce__` method takes no argument and shall return either a string or preferably a tuple (the returned object is often referred to as the "reduce value").

If a string is returned, the string should be interpreted as the name of a global variable. It should be the object's local name relative to its module; the pickle module searches the module namespace to determine the object's module. This behaviour is typically useful for singletons.

When a tuple is returned, it must be between two and six items long. Optional items can either be omitted, or ``None`` can be provided as their value. The semantics of each item are in order:

- .. XXX Mention newobj special-case?
- * A callable object that will be called to create the initial version of the object.
- * A tuple of arguments for the callable object. An empty tuple must be given if the callable does not accept any argument.
- * Optionally, the object's state, which will be passed to the object's :meth:`_setstate__` method as previously described. If the object has no such method then, the value must be a dictionary and it will be added to the object's :attr:`~object.__dict__` attribute.
- * Optionally, an iterator (and not a sequence) yielding successive items. These items will be appended to the object either using ``obj.append(item)`` or, in batch, using ``obj.extend(list_of_items)``. This is primarily used for list subclasses, but may be used by other classes as long as they have :meth:`append` and :meth:`extend` methods with the appropriate signature. (Whether :meth:`append` or :meth:`extend` is used depends on which pickle protocol version is used as well as the number of items to append, so both must be supported.)
- * Optionally, an iterator (not a sequence) yielding successive key-value pairs. These items will be stored to the object using ``obj[key] = value``. This is primarily used for dictionary subclasses, but may be used by other classes as long as they implement :meth:` setitem `.
- * Optionally, a callable with a ``(obj, state)`` signature. This callable allows the user to programmatically control the state-updating behavior of a specific object, instead of using ``obj``'s static :meth:`_setstate_` method. If not ``None``, this callable will have priority over ``obj``'s :meth:`_setstate_`.
 - .. versionadded:: 3.8
 The optional sixth tuple item, ``(obj, state)``, was added.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 730)

Unknown directive type "method".

.. method:: object.__reduce_ex__(protocol)

Alternatively, a :meth: __reduce_ex__ `method may be defined. The only difference is this method should take a single integer argument, the protocol version. When defined, pickle will prefer it over the :meth: __reduce__ `method. In addition, :meth: __reduce__ `automatically becomes a synonym for the extended version. The main use for this method is to provide backwards-compatible reduce values for older Python releases.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 826); backlink

Unknown interpreted text role "meth".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 826); backlink

Unknown interpreted text role "meth".

```
class TextReader:
    """Print and number lines in a text file."""
    def __init__(self, filename):
        self.filename = filename
        self.file = open(filename)
        self.lineno = 0
    def readline(self):
        self.lineno += 1
        line = self.file.readline()
        if not line:
            return None
        if line.endswith('\n'):
            line = line[:-1]
        return "%i: %s" % (self.lineno, line)
    def __getstate__(self):
        # Copy the object's state from self.__dict_
                                                      which contains
        # all our instance attributes. Always use the dict.copy()
        # method to avoid modifying the original state.
        state = self.__dict__.copy()
        # Remove the unpicklable entries.
        del state['file']
        return state
    def setstate (self, state):
        \ensuremath{\sharp} Restore instance attributes (i.e., filename and lineno).
        self. dict .update(state)
        # Restore the previously opened file's state. To do so, we need to
        # reopen it and read from it until the line count is restored.
        file = open(self.filename)
        for .
             in range(self.lineno):
            file.readline()
        # Finally, save the file.
self.file = file
```

A sample usage might be something like this:

```
>>> reader = TextReader("hello.txt")
>>> reader.readline()
'1: Hello world!'
>>> reader.readline()
'2: I am line number two.'
>>> new_reader = pickle.loads(pickle.dumps(reader))
>>> new_reader.readline()
'3: Goodbye!'
```

Custom Reduction for Types, Functions, and Other Objects

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 888)

Unknown directive type "versionadded".

.. versionadded:: 3.8

Sometimes, attr:"~Pickler.dispatch_table may not be flexible enough. In particular we may want to customize pickling based on another criterion than the object's type, or we may want to customize the pickling of functions and classes.

Unknown interpreted text role "attr".

For those cases, it is possible to subclass from the <code>:class:'Pickler'</code> class and implement a <code>:meth:'~Pickler.reducer_override'</code> method. This method can return an arbitrary reduction tuple (see <code>:meth:'__reduce__')</code>. It can alternatively return <code>NotImplemented</code> to fallback to the traditional behavior.

Here is a simple example where we allow pickling and reconstructing a given class:

```
import io
import pickle

class MyClass:
    my_attribute = 1

class MyPickler(pickle.Pickler):
    def reducer_override(self, obj):
        """Custom reducer for MyClass."""
        if getattr(obj, "__name__", None) == "MyClass":
```

Out-of-band Buffers

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]pickle.rst, line 948)

Unknown directive type "versionadded".

.. versionadded:: 3.8
```

In some contexts, the module is used to transfer massive amounts of data. Therefore, it can be important to minimize the number of memory copies, to preserve performance and resource consumption. However, normal operation of the module, as it transforms a graph-like structure of objects into a sequential stream of bytes, intrinsically involves copying data to and from the pickle stream.

Unknown interpreted text role "mod".
```

This constraint can be eschewed if both the *provider* (the implementation of the object types to be transferred) and the *consumer* (the implementation of the communications system) support the out-of-band transfer facilities provided by pickle protocol 5 and higher.

Provider API

The large data objects to be pickled must implement a method specialized for protocol 5 and higher, which returns a reduce_ex_ method specialized for protocol 5 and higher, which returns a reduce_ex_ method specialized for protocol 5 and higher, which returns a reduce_ex_ method specialized for protocol 5 and higher, which returns a reduce_ex_ method specialized for protocol 5 and higher, which returns a reduce_ex_ method specialized for protocol 5 and higher, which returns a reduce_ex_ method specialized for protocol 5 and higher, which returns a reduce_ex_ method specialized for protocol 5 and higher, which returns a reduce_ex_ method specialized for protocol 5 and higher, which returns a reduce_ex_ method specialized for protocol 5 and higher, which returns a reduce_ex_ method specialized for protocol 5 and higher, which returns a reduce_ex_ method specialized for protocol 5 and higher, which returns a reduce_ex_ method specialized for protocol 5 and higher for proto

Unknown interpreted text role "class".
```

A :class: 'PickleBuffer' object signals that the underlying buffer is eligible for out-of-band data transfer. Those objects remain compatible with normal usage of the :mod: 'pickle' module. However, consumers can also opt-in to tell :mod: 'pickle' that they will handle those buffers by themselves.

Unknown interpreted text role "class".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 970); backlink

Unknown interpreted text role "mod".

Unknown interpreted text role "mod".

Consumer API

A communications system can enable custom handling of the :class: PickleBuffer' objects generated when serializing an object graph.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 979); backlink

Unknown interpreted text role "class".

On the sending side, it needs to pass a <code>buffer_callback</code> argument to <code>:class:'Pickler'</code> (or to the <code>:func:'dump'</code> or <code>:func:'dumps'</code> function), which will be called with each <code>:class:'PickleBuffer'</code> generated while pickling the object graph. Buffers accumulated by the <code>buffer_callback</code> will not see their data copied into the pickle stream, only a cheap marker will be inserted.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 982); backlink

Unknown interpreted text role "class".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 982); backlink

Unknown interpreted text role "class".

On the receiving side, it needs to pass a *buffers* argument to :class: 'Unpickler' (or to the :func: load' or :func: loads' function), which is an iterable of the buffers which were passed to *buffer_callback*. That iterable should produce buffers in the same order as they were passed to *buffer_callback*. Those buffers will provide the data expected by the reconstructors of the objects whose pickling produced the original :class: 'PickleBuffer' objects.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 989); backlink

Unknown interpreted text role "class".
```

Between the sending side and the receiving side, the communications system is free to implement its own transfer mechanism for outof-band buffers. Potential optimizations include the use of shared memory or datatype-dependent compression.

Example

Here is a trivial example where we implement a :class: bytearray' subclass able to participate in out-of-band buffer pickling:

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]pickle.rst, line 1005); backlink
Unknown interpreted text role "class".
```

```
class ZeroCopyByteArray(bytearray):
                    _(self, protocol):
         reduce_ex_
        if protocol >= 5:
           return type(self). reconstruct, (PickleBuffer(self),), None
        else:
            # PickleBuffer is forbidden with pickle protocols <= 4.
            return type(self). reconstruct, (bytearray(self),)
    @classmethod
   def reconstruct(cls, obj):
        with memoryview(obj) as m:
            # Get a handle over the original buffer object
            obj = m.obj
            if type(obj) is cls:
                # Original buffer object is a ZeroCopyByteArray, return it
                # as-is.
                return obj
            else:
                return cls(obj)
```

The reconstructor (the _reconstruct class method) returns the buffer's providing object if it has the right type. This is an easy way to simulate zero-copy behaviour on this toy example.

On the consumer side, we can pickle those objects the usual way, which when unserialized will give us a copy of the original object:

```
b = ZeroCopyByteArray(b"abc")
data = pickle.dumps(b, protocol=5)
new_b = pickle.loads(data)
print(b == new_b)  # True
print(b is new_b)  # False: a copy was made
```

But if we pass a buffer_callback and then give back the accumulated buffers when unserializing, we are able to get back the original object:

```
b = ZeroCopyByteArray(b"abc")
buffers = []
data = pickle.dumps(b, protocol=5, buffer_callback=buffers.append)
new_b = pickle.loads(data, buffers=buffers)
print(b == new_b)  # True
print(b is new_b)  # True: no copy was made
```

This example is limited by the fact that 'class:'bytearray' allocates its own memory: you cannot create a 'class:'bytearray' instance that is backed by another object's memory. However, third-party datatypes such as NumPy arrays do not have this limitation, and allow use of zero-copy pickling (or making as few copies as possible) when transferring between distinct processes or systems.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 1052); backlink

Unknown interpreted text role "class".

```

Restricting Globals

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 1067)

Unknown directive type "index".

.. index::
    single: find_class() (pickle protocol)
```

By default, unpickling will import any class or function that it finds in the pickle data. For many applications, this behaviour is unacceptable as it permits the unpickler to import and invoke arbitrary code. Just consider what this hand-crafted pickle data stream does when loaded:

```
>>> import pickle
>>> pickle.loads(b"cos\nsystem\n(S'echo hello world'\ntR.")
hello world
0
```

In this example, the unpickler imports the :func:`os.system` function and then apply the string argument "echo hello world". Although this example is inoffensive, it is not difficult to imagine one that could damage your system.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 1080); backlink

Unknown interpreted text role "fine".
```

For this reason, you may want to control what gets unpickled by customizing meth:"Unpickler.find_class. Unlike its name suggests, meth:"Unpickler.find_class' is called whenever a global (i.e., a class or a function) is requested. Thus it is possible to either completely forbid globals or restrict them to a safe subset.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 1084); backlink
Unknown interpreted text role "meth".
```

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 1084); backlink
Unknown interpreted text role "meth".
```

Here is an example of an unpickler allowing only few safe classes from the :mod:`builtins` module to be loaded:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 1090); backlink
Unknown interpreted text role "mod".

```
import builtins
import io
import pickle

safe_builtins = {
    'range',
    'complex',
    'set',
    'frozenset',
    'slice',
}

class RestrictedUnpickler(pickle.Unpickler):
```

A sample usage of our unpickler working as intended:

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]pickle.rst, line 1138); backlink
Unknown interpreted text role "mod".
```

Performance

Recent versions of the pickle protocol (from protocol 2 and upwards) feature efficient binary encodings for several common features and built-in types. Also, the mod:"pickle module has a transparent optimizer written in C.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 1147); backlink
Unknown interpreted text role "mod".
```

Examples

For the simplest code, use the :func:'dump' and :func:'load' functions.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 1157); backlink
Unknown interpreted text role "func".
```

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]pickle.rst, line 1157); backlink

Unknown interpreted text role "func".

```
import pickle

# An arbitrary collection of objects supported by pickle.
data = {
    'a': [1, 2.0, 3+4j],
    'b': ("character string", b"byte string"),
    'c': {None, True, False}
}

with open('data.pickle', 'wb') as f:
    # Pickle the 'data' dictionary using the highest protocol available.
    pickle.dump(data, f, pickle.HIGHEST PROTOCOL)
```

The following example reads the resulting pickled data.

```
import pickle
with open('data.pickle', 'rb') as f:
    # The protocol version used is detected automatically, so we do not
    # have to specify it.
    data = pickle.load(f)
```
