Deno runtime tests

Files in this directory are unit tests for Deno runtime.

Testing Deno runtime code requires checking API under different runtime permissions. To accomplish this all tests exercised are created using <code>Deno.test()</code> function.

```
import {} from "./test_util.ts";

Deno.test(function simpleTestFn(): void {
    // test code here
});

Deno.test(
    {
        ignore: Deno.build.os === "windows",
        permissions: { read: true, write: true },
    },
    function complexTestFn(): void {
        // test code here
    },
};
```

Running tests

There are two ways to run unit_test_runner.ts:

```
# Run all tests.
target/debug/deno test --allow-all --unstable --location=http://js-unit-
tests/foo/bar cli/tests/unit/

# Run a specific test module
target/debug/deno test --allow-all --unstable --location=http://js-unit-
tests/foo/bar cli/tests/unit/files_test.ts
```

Http server

target/debug/test_server is required to run when one's running unit tests. During CI it's spawned automatically, but if you want to run tests manually make sure that server is spawned otherwise there'll be cascade of test failures.
