Scaleway Guide

Introduction

Scaleway is a cloud provider supported by Ansible, version 2.6 or higher via a dynamic inventory plugin and modules. Those modules are:

• <a href="reff": scaleway_sshkey_module": adds a public SSH key from a file or value to the Packet infrastructure. Every subsequently-created device will have this public key installed in .ssh/authorized keys.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\scenario_guides\(ansible-devel) (docs) (docsite) (rst) (scenario_guides) guide_scaleway.rst, line 15); backlink

Unknown interpreted text role "ref".
```

 ref: scaleway_compute_module `: manages servers on Scaleway. You can use this module to create, restart and delete servers.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\scenario_guides\(ansible-devel) (docs) (docsite) (rst) (scenario_guides) guide_scaleway.rst, line 16); backlink

Unknown interpreted text role "ref".
```

• ref. scaleway_volume_module: manages volumes on Scaleway.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\scenario_guides\(ansible-devel) (docs) (docsite) (rst) (scenario_guides) guide_scaleway.rst, line 17); backlink
Unknown interpreted text role "ref".
```

Note

This guide assumes you are familiar with Ansible and how it works. If you're not, have a look at ref ansible_documentation before getting started.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\scenario_guides\(ansible-devel) (docs) (docsite) (rst) (scenario_guides) guide_scaleway.rst, line 20); backlink
```

Requirements

The Scaleway modules and inventory script connect to the Scaleway API using Scaleway REST API. To use the modules and inventory script you'll need a Scaleway API token. You can generate an API token via the Scaleway console here. The simplest way to authenticate yourself is to set the Scaleway API token in an environment variable:

```
$ export SCW_TOKEN=00000000-1111-2222-3333-444444444444
```

If you're not comfortable exporting your API token, you can pass it as a parameter to the modules using the api_token argument. If you want to use a new SSH key pair in this tutorial, you can generate it to ./id rsa and ./id rsa.pub as:

```
$ ssh-keygen -t rsa -f ./id_rsa
```

If you want to use an existing key pair, just copy the private and public key over to the playbook directory.

How to add an SSH key?

Connection to Scaleway Compute nodes use Secure Shell. SSH keys are stored at the account level, which means that you can reuse the same SSH key in multiple nodes. The first step to configure Scaleway compute resources is to have at least one SSH key configured.

ref: scaleway_sshkey_module' is a module that manages SSH keys on your Scaleway account. You can add an SSH key to your account by including the following task in a playbook:

```
System \, Message: ERROR/3 \ (\cite{Message: properties of the pr
```

```
- name: "Add SSH key"
scaleway_sshkey:
ssh pub key: "ssh-rsa AAAA..."
state: "present"
```

The ssh pub key parameter contains your ssh public key as a string. Here is an example inside a playbook:

```
- name: Test SSH key lifecycle on a Scaleway account
hosts: localhost
gather_facts: no
environment:
   SCW_API_KEY: ""

tasks:

- scaleway_sshkey:
   ssh pub key: "ssh-rsa AAAAB...424242 developer@example.com"
   state: present
   register: result

- assert:
   that:
   - result is success and result is changed
```

How to create a compute instance?

Unknown interpreted text role 'ref'.

Now that we have an SSH key configured, the next step is to spin up a server! reff'scaleway_compute_module' is a module that can create, update and delete Scaleway compute instances:

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\scenario_guides\(ansible-devel) (docs) (docsite) (rst) (scenario_guides) guide_scaleway.rst, line 93); backlink
Unknown interpreted text role "ref".
```

```
- name: Create a server scaleway_compute: name: foobar state: present image: 00000000-1111-2222-3333-44444444444 organization: 00000000-1111-2222-3333-44444444444 region: ams1 commercial_type: START1-S
```

Here are the parameter details for the example shown above:

- name is the name of the instance (the one that will show up in your web console).
- image is the UUID of the system image you would like to use. A list of all images is available for each availability zone.
- organization represents the organization that your account is attached to.
- region represents the Availability Zone which your instance is in (for this example, parl and amsl).
- commercial_type represents the name of the commercial offers. You can check out the Scaleway pricing page to find which instance is right for you.

Take a look at this short playbook to see a working example using scaleway_compute:

```
- debug: var=server creation task
- assert:
    that:
      - server_creation_task is success
      - server creation task is changed
- name: Run it
  scaleway compute:
   name: foobar
    state: running
   image: 00000000-1111-2222-3333-444444444444
   organization: 00000000-1111-2222-3333-444444444444
    region: ams1
   commercial_type: START1-S
    wait: true
    tags:
      - web server
  register: server run task
- debug: var=server_run_task
- assert:
    that:
      - server_run_task is success
      - server_run_task is changed
```

Dynamic Inventory Script

Ansible ships with ref.'scaleway_inventory'. You can now get a complete inventory of your Scaleway resources through this plugin and filter it on different parameters (regions and tags are currently supported).

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\scenario_guides\(ansible-devel) (docs) (docsite) (rst) (scenario_guides) guide_scaleway.rst, line 172); backlink

Unknown interpreted text role 'ref'.
```

Let's create an example! Suppose that we want to get all hosts that got the tag web_server. Create a file named scaleway_inventory.yml with the following content:

```
plugin: scaleway
regions:
   - ams1
   - par1
tags:
   - web_server
```

This inventory means that we want all hosts that got the tag web_server on the zones ams1 and par1. Once you have configured this file, you can get the information using the following command:

```
$ ansible-inventory --list -i scaleway_inventory.yml
```

The output will be:

```
" meta": {
    "hostvars": {
        "dd8e3ae9-0c7c-459e-bc7b-aba8bfa1bb8d": {
            "ansible_verbosity": 6,
            "arch": "x86 64",
            "commercial_type": "START1-S",
"hostname": "foobar",
             "ipv4": "192.0.2.1",
             "organization": "00000000-1111-2222-3333-444444444444",
             "state": "running",
             "tags": [
                 "web_server"
    }
"all": {
    "children": [
        "ams1",
        "par1",
        "ungrouped",
        "web server"
    1
"ams1": {},
"par1": {
```

As you can see, we get different groups of hosts. parl and amsl are groups based on location. web_server is a group based on a tag.

In case a filter parameter is not defined, the plugin supposes all values possible are wanted. This means that for each tag that exists on your Scaleway compute nodes, a group based on each tag will be created.

Scaleway S3 object storage

Object Storage allows you to store any kind of objects (documents, images, videos, and so on). As the Scaleway API is S3 compatible, Ansible supports it natively through the modules: ref"; ref"'s3_bucket_module', ref"'aws_s3_module'.

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\scenario_guides\(ansible-devel) (docs) (docsite) (rst) (scenario_guides) guide_scaleway.rst, line 249); backlink
Unknown interpreted text role "ref".
```

```
System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\ansible-devel\docs\docsite\rst\scenario_guides\(ansible-devel) (docs) (docsite) (rst) (scenario_guides) guide_scaleway.rst, line 249); backlink
Unknown interpreted text role "ref".
```

You can find many examples in the scaleway_s3 integration tests.

```
- hosts: myserver
 vars:
   scaleway region: nl-ams
   s3 url: https://s3.nl-ams.scw.cloud
 environment:
   # AWS ACCESS KEY matches your scaleway organization id available at https://cloud.scaleway.com/#/accou
   AWS ACCESS KEY: 00000000-1111-2222-3333-444444444444
   # AWS SECRET KEY matches a secret token that you can retrieve at https://cloud.scaleway.com/#/credenti
   AWS SECRET KEY: aaaaaaaa-bbbb-cccc-dddd-eeeeeeeee
 module defaults:
   group/aws:
     s3_url: '{{ s3 url }}'
     region: '{{ scaleway_region }}'
 tasks:
  # use a fact instead of a variable, otherwise template is evaluate each time variable is used
   - set fact:
       bucket name: "{{ 99999999 | random | to uuid }}"
   # "requester pays:" is mandatory because Scaleway doesn't implement related API
   # another way is to use aws s3 and "mode: create" !
   - s3 bucket:
       name: '{{ bucket name }}'
       requester_pays:
   - name: Another way to create the bucket
     aws s3:
       bucket: '{{ bucket name }}'
       mode: create
       encrypt: false
     register: bucket creation check
   - name: add something in the bucket
       mode: put
       bucket: '{{ bucket name }}'
       src: /tmp/test.txt # needs to be created before
       object: test.txt
       encrypt: false # server side encryption must be disabled
```
