# **Update Angular**

This guide contains information to update to Angular version 13.

# **Update Angular CLI applications**

For step-by-step instructions on how to update to the latest Angular release and leverage the Angular automated migration tools, use the interactive update guide at <u>update.angular.io</u>.

# Changes and deprecations in version 13

For information about the deprecation and removal practices of Angular, see Angular Release Practices.

#### • Removal of View Engine

Requires all applications and libraries to build using Ivy. See the <u>Upcoming improvements to Angular library</u> <u>distribution</u> blog.

## • Modernization of the Angular Package Format (APF)

Removed older output formats, including View Engine specific metadata.

#### • Removal of IE11 Support

Removes all support for Microsoft Internet Explorer 11 (IE11). See <u>Issue #41840</u>.

#### Testbed module teardown

Adds the option in initTestEnvironment to completely remove test environments from an application. See the <a href="Improving Angular tests by enabling Angular testing module teardown">Improving Angular tests by enabling Angular testing module teardown</a> article.

### • \$localize tagged message strings

Adds documentation for the Angular \$localize API and tagged message strings.

## Disk Cache

Enables the persistent build cache by default for all applications. See <u>Issue #21545</u>.

## **Breaking changes in Angular version 13**

{@a breaking-changes}

	Details
PR #43642	TypeScript versions older than 4.4.2 are no longer supported.
PR #43740	NodeJS versions older than $v12.20.0$ are no longer supported. The Angular packages now use the NodeJS package exports feature with subpath patterns and requires a NodeJS version above 14.15.0 or 16.10.0.
PR #31187	Previously, the default url serializer dropped everything after and including a question mark in query parameters. That is, for a navigation to /path?q=hello?&other=123, the query parameters parsed to just {q: 'hello'}. This is incorrect, because the URI spec allows for

	<pre>parameters for /path?q=hello?&amp;other=123 as {q: 'hello?', other: '123'}.</pre>	
<u>PR #41730</u>	The behavior of the SpyLocation used by the RouterTestingModule has changed to match the behavior of browsers. It no longer emits a popstate event when Location.go is called. In addition, simulateHashChange now triggers both a hashchange event and a popstate event.  Tests that use location.go and expect the changes to be picked up by the Router should migrate to simulateHashChange. Each test is different in what it attempts to assert, so there is no single change that works for all tests. Each test that uses the SpyLocation to simulate changes in the browser URL should be evaluated on a case-by-case basis.	
<u>PR #42952</u>	A new type called FormControlStatus has been introduced, which is a union of all possible status strings for form controls. AbstractControl.status has been narrowed from string to FormControlStatus, and statusChanges has been narrowed from observable <any> to Observable<formcontrolstatus>. Most applications should consume the new types seamlessly. Any breakage caused by this change is likely due to one of the following two problems:  1. The app is comparing AbstractControl.status against a string which is not a valid status.  2. The app is using statusChanges events as if they were something other than strings.</formcontrolstatus></any>	
PR #43087	Previously ,null and undefined inputs for routerLink were equivalent to empty string and there was no way to disable the navigation of the link. In addition, the href is changed from a property HostBinding() to an attribute binding (HostBinding('attr.href')). The effect of this change is that DebugElement.properties['href'] now returns the href value returned by the native element which is the full URL rather than the internal value of the RouterLink href property.	
PR #4349 <u>6</u>	The router no longer replaces the browser URL when a new navigation cancels an ongoing navigation. The replacement of the browser URL often caused URL flicker and was only in place to support some AngularJS hybrid applications. Hybrid applications which rely on the presence of navigationId on each initial navigation handled by the Angular router should instead subscribe to NavigationCancel events and manually perform the location.replaceState to add navigationId to the Router state.  In addition, tests that assert urlChanges on the SpyLocation should be adjusted to account for the lack of the replaceState trigger.	
PR #43507	The WrappedValue class is no longer imported from @angular/core. This change may result in compile errors or failures at runtime, if outdated libraries are used that rely on WrappedValue. Dependancy on WrappedValue should be removed since no replacement is available.	
PR #43591	It is no longer possible to use Route.loadChildren with a string value. The following supporting classes were removed from @angular/core:  NgModuleFactoryLoader SystemJsNgModuleFactoryLoader The @angular/router package no longer exports the following symbols: SpyNgModuleFactoryLoader DeprecatedLoadChildren	
	The signature of the setupTestingRouter function from @angular/core/testing was changed to drop the NgModuleFactoryLoader parameter, since an value for that parameter can not be	

	created.
PR #43668	The return type of SwUpdate#activateUpdate and SwUpdate#checkForUpdate changed to Promise <boolean>.  Although unlikely, this change may cause TypeScript type-checking to fail in some cases. If necessary, update your types to account for the new return type.</boolean>
PR #43791	When storing and retrieving a DetachedRouteHandle, the Router traverses the Route children in order to correctly allow storing a parent route when there are several possible child Route configs that can be stored. This allows a RouteReuseStrategy to store a parent Route and a child, while preserving the ability to change the child route while restoring the parent. Some implementations of RouteReuseStrategy will need to be updated to correctly store and retrieve the DetachedRouteHandle of descendants as well as the stored parent ActivatedRouteSnapshot.  Previously, the Router would only store the parent, making it impossible to change descendant paths when a parent stored was retrieved. See Issue #20114
Issue #22159	Scripts that load via dynamic import() are now treated as ES modules (meaning they must be strict mode-compatible).

# **New deprecations**

{@a deprecations}

Removed	Replacement	Details
<u>getModuleFactory</u>	getNgModuleById	
Factory-based signature of <pre>ApplicationRef.bootstrap</pre>	Type-based signature of <pre>ApplicationRef.bootstrap</pre>	Use the Type-based signature in place of the Factory-based signature.
PlatformRef.bootstrapModuleFactory	PlatformRef.bootstrapModule	
<u>ModuleWithComponentFactories</u>	none	
Compiler	none	
<u>CompilerFactory</u>	none	
<u>NgModuleFactory</u>	Non-factory based framework APIs	Use the non-factory based framework APIs, such as PlatformRef.bootstrapModule and createNgModuleRef.
Factory-based signature of <pre>ViewContainerRef.createComponent</pre>	Type-based signature of  ViewContainerRef.createComponent	Use the Type-based signature in place of the Factory-based signature.
aotSummaries parameter of the  TestBed.initTestEnvironment  method	none	
aotSummaries parameter of the  TestModuleMetadata type	none	

<u>renderModuleFactory</u>	<u>renderModule</u>	
SwUpdate#activated	SwUpdate#activateUpdate()	Use the return value of <pre>SwUpdate#activateUpdate().</pre>
<u>SwUpdate#available</u>	SwUpdate#versionUpdates	
bind-input="value"	[input]="value"	
bind-animate-trigger="value"	[@trigger]="value"	
on-click="onClick()"	(click)="onClick()"	
bindon-ngModel="value"	[(ngModel)]="value"	
ref-templateRef	#templateRef
