## Linux Kernel patch submission checklist

Here are some basic things that developers should do if they want to see their kernel patch submissions accepted more quickly.

These are all above and beyond the documentation that is provided in <a href="Documentation/process/submitting-patches.rst">ref: Documentation/process/submitting-patches.rst</a> <a href="submittingpatches">submittingpatches</a> and elsewhere regarding submitting Linux kernel patches.

 $System \, Message: ERROR/3 \, (\mbox{D:\nonboarding-resources} \mbox{linux-master) (Documentation) (process) submit-checklist.rst, line 9); } backlink$

- 1. If you use a facility then #include the file that defines/declares that facility. Don't depend on other header files pulling in ones that you use.
- 2. Builds cleanly:
  - a. with applicable or modified CONFIG options =y, =m, and =n. No goo warnings/errors, no linker warnings/errors.
  - b. Passes allnoconfig, allmodconfig
  - c. Builds successfully when using O=builddir
  - d. Any Documentation/ changes build successfully without new warnings/errors. Use make htmldocs or make pdfdocs to check the build and fix any issues.
- 3. Builds on multiple CPU architectures by using local cross-compile tools or some other build farm
- 4. ppc64 is a good architecture for cross-compilation checking because it tends to use unsigned long for 64-bit quantities.
- 5. Check your patch for general style as detailed in <a href="mailto:ref">ref</a>. Documentation/process/coding-style.rst <codingstyle>`. Check for trivial violations with the patch style checker prior to submission (scripts/checkpatch.pl). You should be able to justify all violations that remain in your patch.

- 6. Any new or modified CONFIG options do not muck up the config menu and default to offunless they meet the exception criteria documented in <code>Documentation/kbuild/kconfig-language.rst</code> Menu attributes: default value.
- 7. All new Kconfig options have help text.
- 8. Has been carefully reviewed with respect to relevant Kconfig combinations. This is very hard to get right with testing -- brainpower pays offhere.
- 9. Check cleanly with sparse.
- 10. Use make checkstack and fix any problems that it finds.

## Note

checkstack does not point out problems explicitly, but any one function that uses more than 512 bytes on the stack is a candidate for change.

11. Include <a href="ref":kernel-doc</a> <a href="kernel-doc">kernel\_doc</a> to document global kernel APIs. (Not required for static functions, but OK there also.) Use <a href="make">make</a> <a href="https://docs.or.make">https://docs.or.make</a> <a href="pdfdocs.or.make">pdfdocs</a> to check the <a href="ref":kernel-doc</a> <a href="kernel-doc">kernel\_doc</a> and fix any issues.

- 12. Has been tested with <code>config\_preempt</code>, <code>config\_debug\_preempt</code>, <code>config\_debug\_slab</code>, <code>config\_debug\_pagealloc</code>, <code>config\_debug\_mutexes</code>, <code>config\_debug\_spinlock</code>, <code>config\_debug\_atomic\_sleep</code>, <code>config\_prove\_rcu</code> and <code>config\_debug\_objects</code> <code>RCU</code> <code>HEAD</code> all simultaneously enabled.
- 13. Has been build- and runtime tested with and without CONFIG SMP and CONFIG PREEMPT.
- 14. All codepaths have been exercised with all lockdep features enabled.
- 15. All new /proc entries are documented under Documentation/
- 16. All new kernel boot parameters are documented in Documentation/admin-guide/kernel-parameters.rst.
- 17. All new module parameters are documented with MODULE PARM DESC ()
- 18. All new userspace interfaces are documented in <code>Documentation/ABI/</code>. See <code>Documentation/ABI/</code>README for more information. Patches that change userspace interfaces should be CCed to <code>linux-api@vger.kernel.org</code>.
- 19. Has been checked with injection of at least slab and page-allocation failures. See Documentation/fault-injection/.

  If the new code is substantial, addition of subsystem-specific fault injection might be appropriate.
- 20. Newly-added code has been compiled with gcc -W (use make KCFLAGS=-W). This will generate lots of noise, but is good for finding bugs like "warning: comparison between signed and unsigned".
- 21. Tested after it has been merged into the -mm patches to make sure that it still works with all of the other queued patches and various changes in the VM, VFS, and other subsystems.
- 22. All memory barriers {e.g., barrier(), rmb(), wmb()} need a comment in the source code that explains the logic of what they are doing and why.
- 23. If any ioct's are added by the patch, then also update Documentation/userspace-api/ioctl/ioctl-number.rst.
- 24. If your modified source code depends on or uses any of the kernel APIs or features that are related to the following Kconfig symbols, then test multiple builds with the related Kconfig symbols disabled and/or =m (if that option is available) [not all of these at the same time, just various/random combinations of them]:

CONFIG\_SMP, CONFIG\_SYSFS, CONFIG\_PROC\_FS, CONFIG\_INPUT, CONFIG\_PCI, CONFIG\_BLOCK, CONFIG\_PM, CONFIG MAGIC SYSRQ, CONFIG NET, CONFIG INET=n (but latter with CONFIG NET=y).
