.. c:macro:: VIDIOC_ENUM_FRAMEINTERVALS

int ioctl(int fd, VIDIOC ENUM FRAMEINTERVALS, struct v412 frmivalenum *argp)

Arguments

fd

File descriptor returned by :c:func:'open()'.

 $System\ Message: ERROR/3\ (\texttt{D:\nonboarding-resources}\ sample-onboarding-resources \ linux-master) \\ (Documentation)\ (userspace-api)\ (media)\ (v41)\ vidioc-enum-frameintervals.rst, \ line\ 26); \\ backlink$

Unknown interpreted text role "c:func".

arqp

Pointer to struct :c:type: v412 firmivalenum that contains a pixel format and size and receives a frame interval.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v41\(linux-master) (Documentation) (userspace-api) (media) (v41) vidioc-enum-frameintervals.rst, line 29); backlink

Unknown interpreted text role "c:type".

Description

This ioctl allows applications to enumerate all frame intervals that the device supports for the given pixel format and frame size.

The supported pixel formats and frame sizes can be obtained by using the ref:'VIDIOC_ENUM_FMT' and ref:'VIDIOC_ENUM_FRAMESIZES' functions.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\userspace-api\media\v41\(linux-master) (Documentation) (userspace-api) (media) (v41) vidioc-enum-frameintervals.rst, line 38); backlink

Unknown interpreted text role 'ref'.

The return value and the content of the $v412_frmivalenum$. type field depend on the type of frame intervals the device supports. Here are the semantics of the function for the different cases:

- **Discrete:** The function returns success if the given index value (zero-based) is valid. The application should increase the index by one for each call until EINVAL is returned. The *v4l2_frmivalenum.type* field is set to *V4L2_FRMIVAL_TYPE_DISCRETE* by the driver. Of the union only the *discrete* member is valid.
- Step-wise: The function returns success if the given index value is zero and EINVAL for any other index value. The v412_frmivalenum.type field is set to V4L2_FRMIVAL_TYPE_STEPWISE by the driver. Of the union only the stepwise member is valid.
- Continuous: This is a special case of the step-wise type above. The function returns success if the given index value is zero and EINVAL for any other index value. The v4l2_frmivalenum.type field is set to V4L2_FRMIVAL_TYPE_CONTINUOUS by the driver. Of the union only the stepwise member is valid and the step value is set to 1.

When the application calls the function with index zero, it must check the type field to determine the type of frame interval enumeration the device supports. Only for the V4L2_FRMIVAL_TYPE_DISCRETE type does it make sense to increase the index value to receive more frame intervals.

Note

The order in which the frame intervals are returned has no special meaning. In particular does it not say anything about potential default frame intervals.

Applications can assume that the enumeration data does not change without any interaction from the application itself. This means that the enumeration data is consistent if the application does not perform any other ioctl calls while it runs the frame interval enumeration.

Note

Frame intervals and frame rates: The V4L2 API uses frame intervals instead of frame rates. Given the frame interval the frame rate can be computed as follows:

```
frame_rate = 1 / frame_interval
```

Structs

In the structs below, *IN* denotes a value that has to be filled in by the application, *OUT* denotes values that the driver fills in. The application should zero out all members except for the *IN* fields.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the ref. Generic Error Codes <gen-errors>` chapter.
