Format the legend keys any way you want by using alias patterns.

- Example for Azure Monitor: `dimension: {{dimensionvalue}}`
- Example for Application Insights: `server: {{groupbyvalue}}`

Alias Patterns for Application Insights

- {{groupbyvalue}} = replaced with the value of the group by
- {{groupbyname}} = replaced with the name/label of the group by
- {{metric}} = replaced with metric name (e.g. requests/count)

Alias Patterns for Azure Monitor

- {{resourcegroup}} = replaced with the value of the Resource Group
- {{namespace}} = replaced with the value of the Namespace (e.g. Microsoft.Compute/virtualMachines)
- {{resourcename}} = replaced with the value of the Resource Name
- {{metric}} = replaced with metric name (e.g. Percentage CPU)
- {{dimensionname}} = replaced with dimension key/label (e.g. blobtype)
- {{dimensionvalue}} = replaced with dimension value (e.g. BlockBlob)

Filter Expressions for Application Insights   The filter field takes an OData filter expression.

Examples:

- `client/city eq 'Boydton'`
- `client/city ne 'Boydton'`
- `client/city ne 'Boydton' and client/city ne 'Dublin'`
- `client/city eq 'Boydton' or client/city eq 'Dublin'`

Writing Queries for Template Variables   See the docs for details and examples.
