A statically generated blog example using Next.js, Markdown, and TypeScript

This is the existing [blog-starter](#) plus TypeScript.

This example showcases Next.js's [Static Generation](#) feature using Markdown files as the data source.

The blog posts are stored in `/_posts` as Markdown files with front matter support. Adding a new Markdown file in there will create a new blog post.

To create the blog posts we use `remark` and `remark-html` to convert the Markdown files into an HTML string, and then send it down as a prop to the page. The metadata of every post is handled by `gray-matter` and also sent in props to the page.

Deploy your own

Deploy the example using [Vercel](#) or preview live with [StackBlitz](#)

▲   Deploy

How to use

Execute `create-next-app` with [npm](#) or [Yarn](#) to bootstrap the example:

```
npx create-next-app --example blog-starter-typescript blog-starter-typescript-app
# or
yarn create next-app --example blog-starter-typescript blog-starter-typescript-app
# or
pnpm create next-app -- --example blog-starter-typescript blog-starter-typescript-app
```

Your blog should be up and running on http://localhost:3000! If it doesn't work, post on [GitHub discussions](#).

Deploy it to the cloud with [Vercel](#) ([Documentation](#)).

Notes

`blog-starter-typescript` uses [Tailwind CSS (v3.0)](#).
