Roses are red – Links are blue

By default, a browser will display links in blue. Bulma has up until now used the `$primary` color as the `$link` color:

```
// Old styles
$link: $primary !default
```

But the *primary* color is mostly used as the **brand** color, and is not necessarily well suited for links. For readability purposes, and to add more flexibility to your design choices:

- the `$link` color defaults to `$blue`
- `$info` is using the new `$cyan` color
- `$link` has been added to the `$colors` map as well

```
// New styles
$link: $blue !default
$info: $cyan !default
```

```
Deprecation warning
```

```
<p>
  Because the modifier <code>is-link</code> for <strong>buttons</strong> already existed, it
</p>
```

As such, the following components are now **blue**:

- breadcrumb
- dropdown
- navbar
- pagination
- tabs
- menu
- panel

All Bulma elements and components that support **color** modifiers now support the `.is-link` color:

```
<div class="notification is-link">
  Link notification.
</div>
```

```html
<div class="notification is-info">
  Info notification.
</div>

<button class="button is-link">
  Link button
</button>

<button class="button is-info">
  Info button
</button>
```

Link notification.

Info notification.

Link button

Info button

If you want to use the $primary color for your links, just **customize** your Bulma setup by including these rules:

```
$link: $primary !default
$link-invert: $primary-invert !default
$link-focus-border: $primary !default
```
