Set the runtime locale manually

The inital installation of Angular already contains locale data for English in the United States (`en-US`). The [Angular CLI](#) automatically includes the locale data and sets the `LOCALE_ID` value when you use the `--localize` option with `ng_build` command.

To manually set the runtime locale of an application to one other than the automatic value, complete the following actions.

1. Search for the Unicode locale ID in the language-locale combination in [the Angular repository](#).
2. Set the `LOCALE_ID` token.

The following example sets the value of `LOCALE_ID` to `fr` for French.
