PrinterInfo Object

- `name` string - the name of the printer as understood by the OS.
- `displayName` string - the name of the printer as shown in Print Preview.
- `description` string - a longer description of the printer's type.
- `status` number - the current status of the printer.
- `isDefault` boolean - whether or not a given printer is set as the default printer on the OS.
- `options` Object - an object containing a variable number of platform-specific printer information.

The number represented by `status` means different things on different platforms: on Windows its potential values can be found here, and on Linux and macOS they can be found here.

Example

Below is an example of some of the additional options that may be set which may be different on each platform.

```
{
