Disabling HTTP Keep-Alive

Next.js automatically polyfills [node-fetch](#) and enables [HTTP Keep-Alive](#) by default. You may want to disable HTTP Keep-Alive for certain `fetch()` calls or globally.

For a single `fetch()` call, you can add the agent option:

```
import { Agent } from 'https'

const url = 'https://example.com'
const agent = new Agent({ keepAlive: false })
fetch(url, { agent })
```

To override all `fetch()` calls globally, you can use `next.config.js`:

```
module.exports = {
  httpAgentOptions: {
    keepAlive: false,
  },
}
```
