To add a 500 page create a page whose path matches the regex `^\/?500\/?$` (`/500/` , `/500` , `500/` or `500`), most often you'll want to create a React component page at `src/pages/500.js` .

Users will see the 500 error page when runtime errors happen in the [getServerData function](#) of your page.

Gatsby ensures that your 500 page is built as `500.html` . [Gatsby Cloud](#) supports displaying this custom 500 page. If you're hosting your site another way you'll need to set up a custom rule to serve this file for 500 errors.

When developing using `gatsby develop` , you can still preview your 500 page by going to `localhost:8000/500` .
