You can even bind to properties inside an `each` block.

```
{#each todos as todo}
    <div class:done={todo.done}>
        <input
            type=checkbox
            bind:checked={todo.done}
        >

        <input
            placeholder="What needs to be done?"
            bind:value={todo.text}
        >
    </div>
{/each}
```

> Note that interacting with these `<input>` elements will mutate the array. If you prefer to work with immutable data, you should avoid these bindings and use event handlers instead.
