zh-CN

嵌套表单字段需要对 `field` 进行拓展，将 `field.name` 应用于控制字段。

en-US

Nest dynamic field need extends `field` . Pass `field.name` to nest item.

```jsx
import { Form, Input, Button, Space } from 'antd';
import { MinusCircleOutlined, PlusOutlined } from '@ant-design/icons';

const Demo = () => {
  const onFinish = values => {
    console.log('Received values of form:', values);
  };

  return (
    <Form name="dynamic_form_nest_item" onFinish={onFinish} autoComplete="off">
      <Form.List name="users">
        {(fields, { add, remove }) => (
          <>
            {fields.map(({ key, name, ...restField }) => (
              <Space key={key} style={{ display: 'flex', marginBottom: 8 }}
align="baseline">
                <Form.Item
                  {...restField}
                  name={[name, 'first']}
                  rules={[{ required: true, message: 'Missing first name' }]}
                >
                  <Input placeholder="First Name" />
                </Form.Item>
                <Form.Item
                  {...restField}
                  name={[name, 'last']}
                  rules={[{ required: true, message: 'Missing last name' }]}
                >
                  <Input placeholder="Last Name" />
                </Form.Item>
                <MinusCircleOutlined onClick={() => remove(name)} />
              </Space>
            ))}
            <Form.Item>
              <Button type="dashed" onClick={() => add()} block icon={<PlusOutlined
/>}>
                Add field
              </Button>
            </Form.Item>
          </>
        )}
      </Form.List>
      <Form.Item>
```

```
        <Button type="primary" htmlType="submit">
          Submit
        </Button>
      </Form.Item>
    </Form>
  );
};

export default () => <Demo />;
```
