Deprecated features

Passes

Rustdoc has a concept called "passes". These are transformations that `rustdoc` runs on your documentation before producing its final output.

Customizing passes is **deprecated**. The available passes are not considered stable and may change in any release.

In the past the most common use case for customizing passes was to omit the `strip-private` pass. You can do this more easily, and without risk of the pass being changed, by passing --document-private-items.
