Installing Version Control Tools for `go get`

The `go get` fetching of source code is done by using one of the following tools expected to be found on your system:

- **svn** - Subversion, download at: http://subversion.apache.org/packages.html
- **hg** - Mercurial, download at https://www.mercurial-scm.org/downloads
- **git** - Git, download at http://git-scm.com/downloads
- **bzr** - Bazaar, download at http://wiki.bazaar.canonical.com/Download

For example, **git** is used for Github, **hg** is used for Bitbucket, etc.

Refer GoGetProxyConfig for setting proxies for these tools.
