React Divider component

Divider

A divider is a thin line that groups content in lists and layouts.

Dividers separate content into clear groups.

{{"component": "modules/components/ComponentLinkHeader.js"}}

List dividers

The divider renders as an `<hr>` by default. You can save rendering this DOM element by using the `divider` prop on the `ListItem` component.

{{"demo": "ListDividers.js", "bg": true}}

HTML5 specification

In a list, you should ensure the `Divider` is rendered as an `<li>` to match the HTML5 specification. The examples below show two ways of achieving this.

Inset dividers

{{"demo": "InsetDividers.js", "bg": true}}

Subheader dividers

{{"demo": "SubheaderDividers.js", "bg": true}}

Middle divider

{{"demo": "MiddleDividers.js", "bg": true}}

Dividers with text

You can also render a divider with content.

{{"demo": "DividerText.js"}}

Vertical divider

You can also render a divider vertically using the `orientation` prop.

{{"demo": "VerticalDividers.js", "bg": true}}

> Note the use of the `flexItem` prop to accommodate for the flex container.

Vertical with variant middle

You can also render a vertical divider with `variant="middle"`.

{{"demo": "VerticalDividerMiddle.js", "bg": true}}

Vertical with text

You can also render a vertical divider with content.

{{"demo": "VerticalDividerText.js"}}
