Colored man pages plugin

This plugin adds colors to man pages.

To use it, add `colored-man-pages` to the plugins array in your zshrc file:

```
plugins=(... colored-man-pages)
```

It will also automatically colorize man pages displayed by `dman` or `debman`, from debian-goodies.

You can also try to color other pages by prefixing the respective command with `colored`:

```
colored git help clone
```

Customization

The plugin declares global associative array `less_termcap`, which maps termcap capabilities to escape sequences for the `less` pager. This mapping can be further customized by the user after the plugin is loaded. Check out sources for more.

For example: `less_termcap[md]` maps to `LESS_TERMCAP_md` which is the escape sequence that tells `less` how to print something in bold. It's currently shown in bold red, but if you want to change it, you can redefine `less_termcap[md]` in your zshrc file, after OMZ is sourced:

```
less_termcap[md]="${fg_bold[blue]}" # this tells less to print bold text in bold
blue
```
