Images cannot be imported into your custom document.

Why This Error Occurred An attempt to import an image file into `pages/_document.js` was made.

Custom documents aren't compiled for the browser and images statically imported like this will not be displayed.

Possible Ways to Fix It If your image needs to be displayed on every page you can relocate it to your `pages/_app.js` file.

Example

```
//pages/_app.js
import yourImage from "path/to/your/image"
import Image from "next/image"

function MyApp({ Component, pageProps }) {
  return (
    <>
      <Image src={yourImage} alt="your_image_description" />
      <Component {...pageProps} />
    </>
}

export default MyApp
```

If your application is not using image imports with `next/image`, you can disable the built-in loader with the following next.config.js:

```
module.exports = {
  images: {
    disableStaticImages: true,
  },
}
```
