Jump plugin

This plugin allows to easily jump around the file system by manually adding marks. Those marks are stored as symbolic links in the directory `$MARKPATH` (default `$HOME/.marks`)

To use it, add `jump` to the plugins array in your zshrc file:

```
plugins=(... jump)
```

Commands

Command	Description
`jump <mark-name>`	Jump to the given mark
`mark [mark-name]`	Create a mark with the given name or with the name of the current directory if none is provided
`unmark <mark-name>`	Remove the given mark
`marks`	List the existing marks and the directories they point to

Key bindings

Pressing `CTRL+G` substitutes the written mark name for the full path of the mark. For example, with a mark named `mymark` pointing to `/path/to/my/mark`:

```
$ cp /tmp/file mymark<C-g>
```

will become:

```
$ cp /tmp/file /path/to/my/mark
```
