zh-CN

可以通过 then 接口在关闭后运行 callback 。以上用例将在每个 message 将要结束时通过 then 显示新的 message 。

en-US

`message` provides a promise interface for `onClose` . The above example will display a new message when the old message is about to close.

```
import { message, Button } from 'antd';

const success = () => {
  message
    .loading('Action in progress..', 2.5)
    .then(() => message.success('Loading finished', 2.5))
    .then(() => message.info('Loading finished is finished', 2.5));
};

export default () => <Button onClick={success}>Display sequential messages</Button>;
```
