In this section, you will learn Gatsby's approach to [fonts](#) and typography. You will also learn how to use different fonts for styling text in your project.

The three different kinds of fonts covered in this section are:

- **[Local fonts](#)**: For when you have your own custom font file.
- **[Web fonts](#)**: For when you want to use a font from a service like [Google Fonts](#) or [Typekit Web Fonts](#).
- **[Typography.js framework](#)**: For when you want to use a predefined set of fonts from the [Typography.js](#) library.

Gatsby doesn't have an opinion about which [styling approach](#) you choose. Almost every possible option is supported through official and community plugins. (If there isn't a plugin yet for your favorite option, consider [contributing](#) one!)
