The `.block`, probably Bulma's most important feature

The Bulma `block` is a simple element but with a very powerful feature: it provides `1.5rem` margin at the bottom, if it's not the last child.

It exists as its own `.block` CSS class, but its properties are also used on **many other Bulma components**.

For example, if you were to combine a `notification`, and a `pagination`, they would be **automatically spaced evenly**:
