docker-machine plugin for oh my zsh

Usage

docker-vm   Will create a docker-machine with the name "dev" (required only once) To create a second machine call "docker-vm foobar" or pass any other name

docker-up   This will start your "dev" docker-machine (if necessary) and set it as the active one To start a named machine use "docker-up foobar"

docker-switch dev   Use this to activate a running docker-machine (or to switch between multiple machines) You need to call either this or docker-up when opening a new terminal

docker-stop   This will stop your "dev" docker-machine To stop a named machine use "docker-stop foobar"
