activeClassName example

ReactRouter has a convenience property on the `Link` element to allow an author to set the *active* className on a link. This example replicates that functionality using Next's own `Link` .

Deploy your own

Deploy the example using [Vercel](#) or preview live with [StackBlitz](#)

▲ | **Deploy**

How to use

Execute [create-next-app](#) with [npm](#) or [Yarn](#) to bootstrap the example:

```
npx create-next-app --example active-class-name active-class-name-app
# or
yarn create next-app --example active-class-name active-class-name-app
# or
pnpm create next-app -- --example active-class-name active-class-name-app
```

Deploy it to the cloud with [Vercel](#) ([Documentation](#)).
