API routes in Static export

Why This Warning Occurred An `exportPathMap` path was matched to an API route. Statically exporting a Next.js application via `next export` disables API routes.

This command is meant for a static-only setup, and is not necessary to make your application static. Pages in your application without server-side data dependencies will be automatically statically exported by `next build`, including pages powered by `getStaticProps`

Possible Ways to Fix It Use `next build` with platforms that don't require `next export` like https://vercel.com or remove any paths using API routes from your `exportPathMap` in `next.config.js`.
