Filesystems in the Linux kernel

This under-development manual will, some glorious day, provide comprehensive information on how the Linux virtual filesystem (VFS) layer works, along with the filesystems that sit below it. For now, what we have can be found below.

Core VFS documentation

See these manuals for documentation about the VFS layer itself and how its algorithms work.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\filesystems\[linux-master][Documentation][filesystems]index.rst, **line 18)**

Unknown directive type "toctree".

```
.. toctree::
   :maxdepth: 2

   vfs
   path-lookup
   api-summary
   splice
   locking
   directory-locking
   devpts
   dnotify
   fiemap
   files
   locks
   mount_api
   quota
   seq_file
   sharedsubtree
   idmappings

   automount-support

   caching/index

   porting
```

Filesystem support layers

Documentation for the support code within the filesystem layer for use in filesystem implementations.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\filesystems\[linux-master][Documentation][filesystems]index.rst, **line 50)**

Unknown directive type "toctree".

```
.. toctree::
   :maxdepth: 2

   journalling
   fscrypt
   fsverity
   netfs_library
```

Filesystems

Documentation for filesystem implementations.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\filesystems\[linux-master][Documentation][filesystems]index.rst, **line 63)**

Unknown directive type "toctree".

```
.. toctree::
   :maxdepth: 2
