How to Contribute

Pull Requests

We also accept [pull requests](#)!

Generally we like to see pull requests that

- Maintain the existing code style
- Are focused on a single change (i.e. avoid large refactoring or style adjustments in untouched code if not the primary goal of the pull request)
- Have [good commit messages](#)
- Have tests
- Don't decrease the current code coverage (see coverage/lcov-report/index.html)

Building

```
npm install
npm test
```

The `npm test -- dev` implements watching for tests within Node and `karma start` may be used for manual testing in browsers.

If you notice any problems, please report them to the GitHub issue tracker at http://github.com/kpdecker/jsdiff/issues.

Releasing

JsDiff utilizes the [release yeoman generator](#) to perform most release tasks.

A full release may be completed with the following:

```
yo release
npm publish
```
