- Add JavaScript dependencies installation on bin/setup

  Add `yarn install` to bin/setup when using esbuild, webpack, or rollout.

  Carlos Ribeiro

- Use `controller_class_path` in `Rails::Generators::NamedBase#route_url`

  The `route_url` method now returns the correct path when generating a namespaced controller with a top-level model using `--model-name`.

  Previously, when running this command:

  ```
  bin/rails generate scaffold_controller Admin/Post --model-name Post
  ```

  the comments above the controller action would look like:

  ```ruby
  # GET /posts
  def index
    @posts = Post.all
  end
  ```

  afterwards, they now look like this:

  ```ruby
  # GET /admin/posts
  def index
    @posts = Post.all
  end
  ```

  Fixes #44662.

  Andrew White

- No longer add autoloaded paths to `$LOAD_PATH`.

  This means it won't be possible to load them with a manual `require` call, the class or module can be referenced instead.

  Reducing the size of `$LOAD_PATH` speed-up `require` calls for apps not using `bootsnap`, and reduce the size of the `bootsnap` cache for the others.

  Jean Boussier

- Remove default `X-Download-Options` header

  This header is currently only used by Internet Explorer which will be discontinued in 2022 and since Rails 7 does not fully support Internet Explorer this header should not be a default one.
