Gatsby Functions SendGrid Example

🚀 Quick start

1. **Get SendGrid Credentials.**

   Create an account on [SendGrid](#) and verify a "single sender" email address that the function will use for sending emails.

   Add the following **2** environment variables to a file named `.env.development`. You'll need these for the function to be able to send emails:

   - `SENDGRID_API_KEY` : An SendGrid API Key with full access. [SendGrid Docs](#)
   - `SENDGRID_AUTHORIZED_EMAIL` : the "single sender" the email address you verified with SendGrid [SendGrid Docs](#)

   Read more about how Gatsby handles `.env` files and environment variables in the [Gatsby Docs](#)

   You'll also want to add these as environment variables when deploying to Gatsby Cloud. Don't forget to add them to the Preview variables if you plan to add a CMS preview integration.

2. **Start developing.**

   To get started, run `npm install` to install all necessary packages.

   ```
   cd examples/functions-sendgrid-email
   npm install
   npm run develop
   ```

3. **Open the code and start customizing!**

   Your site is now running at http://localhost:8000! You can use the UI on the index page to test the functions or directly access them at http://localhost:8000/api/sendgrid

   Edit `src/pages/index.js` to see your site update in real-time!

4. **Deploy**

You can deploy this example on Gatsby Cloud by copying the example into a new repo and [connecting that to Gatsby Cloud](#).
